Artificial Intelligence is the death of creativity.

OUTLINE:-

1. Introduction.

Thesis statement: Indeed, Artificial Intelligence is the death of creativity because it promotes laziness, hinders brainstorming practices and innovative thinking in young adults by providing them shortcuts. It also discourages creative arts like poetry, ~~creative~~ content writing and designing by eating those jobs.

2. Decoding the term "Artificial Intelligence"

3. Causes behind Artificial Intelligence becoming the death of creativity.

3.1 AI promotes laziness.

3.2 AI quenches the thirst of seeking knowledge from reliable sources.

3.3 AI hinders brainstorming and innovative thinking by providing short-cuts to young adults.

3.4 It is quickly eating up the jobs which belongs to creative arts.

3.5. AI itself steals the creative work of other without consent.

(As reported by "The guardian" - AI used thousands of books without the consent of authors).

3.6 Albania appointed an AI model as the first AI minister.

(A test case for human conscience, creativity and geo-security)

3.7 Rise of AI accounts on social media masquerading as human beings.

4. Conclusion.

"We are living in the age of Artificial Intelligence". This sentence has started to seem like a compulsory sentence, whenever one reads any report, research paper or article regarding Artificial Intelligence. There is no denial to the fact that this ^{era} belongs to Artificial Intelligence. ~~Artificial Intelligence is growing with a very rapid pace day by day,~~ It has become a part of almost every sector and institute of the world ^{from} space missions to the collection of ~~garbage~~, AI is being used everywhere. Although AI is helping mankind in countless ways but its rapid growth and over reliance on this tool is posing serious threats to human creativity. Artificial Intelligence is ~~slowly becoming~~ ^{has become} the death of creativity because it promotes laziness, it provides people especially the young adults with easy shortcuts which hinders their brain maturation and innovative thinking. It also quenches the thirst of seeking knowledge from reliable sources and books by providing ready-made and quick answers which ^{are} often agenda driven and lack the much needed depth and pluralism. Artificial Intelligence, though indirectly, discourages the creative arts by providing superficial content writing and designing skills to the market. ~~AI creators are also facing~~

lawsuits ~~of~~ because of ~~copyright~~ infringements which ~~is~~ takes place during machine learning phase of ~~AI~~ development. AI is also posing geo-political insecurity by taking those jobs which are only meant for human beings like becoming a minister of state. Hence, it is evident that Artificial Intelligence is the death of creativity because it promotes laziness, hinders brainstorming practices and innovative thinking in young adults by providing them shortcuts. It also discourages creative arts like poetry, content writing and designing by eating those jobs.

well done

Artificial Intelligence refers to the outcome of over zealous machine-learning process which enables a machine (a computer) to decode patterns and codes and eventually to think along the patterns of human neural networks. AI enables a machine to not only rephrase or reproduce what is already coded in it but it also enables it to create new information, program new codes, learn from its mistakes and become a thinking device. The process which formerly was only attributed to mankind - thinking and intelligence - is now being adopted by non-living emotion-less machines. It is where from Artificial Intelligence has got its name from, that is Artificial (not natural like human beings) Intelligence (to learn and to think new things).

Artificial Intelligence is the death of creativity because it promotes laziness. It ~~provides answers to every question and solution of every mathematical problem on just one click.~~ It makes school going kids to take their teachers for granted, it also stops them from analyzing difficult questions and pondering on philosophical debates. It makes children ungrateful because they seem to believe that Artificial intelligence is the ultimate teacher. ~~young adults' over reliance on Artificial intelligence~~ make them to knock the door of this tool whenever they get any assignment or when they have to make any project using ~~their own~~ intelligence. This much reliance on Artificial intelligence rusts their own creative skills, as they don't usually think even about simple problems but prefer to give AI a prompt to deal with it. This eventually becomes the case of disuse atrophy - all those skills or muscles which human don't use for long, dies. Same is the case with human creativity, over reliance on AI tools for every small to ~~big~~ task is eventually killing the ~~very~~ creativity that humans were once proud of.

Moreover, Artificial Intelligence also quenches the thirst of seeking knowledge from reliable sources. It further decreases the already declining habit of book reading among young generations. When every information is available on just one click, when one prompt can provide the summary of a well researched book, the habit of reading books to polish cognitive skills is bound to decrease. So, by providing easy way outs AI is not helping young brains but actually it is making them more anaemic and less hardworking and eventually killing their creativity.

Furthermore, Artificial Intelligence is also causing harm to creativity by indirectly snatching away the jobs which belongs to creative artists. Media firms are no longer hiring content writers because they can get their content written from Artificial Intelligence chat bots. Although Artificial Intelligence does not produce content as good as well-polished content writer can, but it is still harming the writers because media outlets, in order to cut their expenses still go to AI and end up producing very monotonous and superficial concepts. So, not only the content writers but viewers also face the ill of over-

reliance on Artificial Intelligence. Same is the case with poetry. Urdu literature has seen the era of Mir Taqi Mir, and then Ibrakim Zouq and Mirza Ghalib, then comes Allama Iqbal and after the creation of Pakistan, people have read from the magical pens of Faiz and Habib Jalib and then ^{from} Ahmed Faraz to Javed Akhtar. Since the advent of Urdu language, every generation has seen a few or at least one poet who revolutionized the whole arena of Urdu poetry because human creativity is a God-gifted skill. It has no other match. And now after the popularization of internet and then Artificial Intelligence, Urdu is devoid of any generational talent, a single poet or story-teller that can produce or create any thing like that of Ghalib, Faiz or Faraz. It is because human creativity is on decline due to over reliance on shortcuts like Artificial Intelligence.

Artificial Intelligence is not only the death of creativity indirectly due to over reliance of humans on it but it also harms the creativity directly. The

~~big~~ tech-giants who produced the major Artificial Intelligence chat-bots have been involved in malpractices and illegalities. The Guardians reported in March 2025 that major tech-giants involved in copyrights infringements of thousands of books without the consent of their authors in order to train their Artificial Intelligence models. After this controversy erupted, a few of the tech-giants also confessed on electronic and social media that they have illegally used paid-contents and books to train their AI models. The authors of those books has ~~taken~~ legal action against the AI companies involved in it, the case is currently going on in the courts of several countries, like The USA and UK. Hence, it is evident from above mentioned case study that Artificial Intelligence is the death of creativity.

Furthermore, Artificial Intelligence is not only the death of creativity but it also poses serious threats to geo-security and human conscience. Recently, Albania has appointed an Artificial Intelligence model as the world's first AI minister. It is not only a breaking news or fun-fact but a serious threat to geo-security and future of human existence on this planet, Earth. This development has

raised serious questions regarding future of politics. It has also warranted excessive criticism because no any law or constitution of any country allows any non-human entity to become a part of executive or raised to the level of a state minister. It has also erupted constitutional as well as philosophical debates like who would be responsible if the AI minister makes a mistake?, what is the future of state secrets?, any many more. Therefore, it can be said that AI is not only the death of creativity but it can also become the cause of death of human species, if left unchecked -

Moreover, the social media platforms which came into being with the purpose of connecting 'human being' across borders and as platforms to showcase human creativity are now seeing the rise in numbers of those accounts which do not belong to human species. Those accounts are being operated by AI models which masqueraded as humans behind the camera. This situation is not only alarming but grave example of how tech -

companies use human trust to further their materialistic interests. It is not just a competition for human creativity but it is also a serious threat regarding cyber-security.

In the nutshell, Artificial Intelligence is the death of creativity because it promotes laziness, hinders brainstorming practices and innovative thinking in young adults by providing them shortcuts. It also discourages creative arts like poetry, content writing and designing by eating those jobs. The over-reliance on Artificial Intelligence is not only the death of creativity but it is also a threat for geo-security, cyber-security and future of human species on this planet, Earth. If Artificial Intelligence is left unchecked or unregulated it can become a serious danger for human existence. Hence, proper Artificial Intelligence regulation on global level and formation of strict policies are the needs of the hour.
