

Climate Change: Causes and Consequences

1) Introduction:

→ Climate change is a long term shifts in temperature and weather patterns.

Thesis Statement:

Climate change can be caused by deforestation, green house gases, industrial activities, transportation emissions and agricultural practices which resulted in the consequences such as rising sea levels, extreme weather events, impacts on biodiversity and impact on human health.

2) Causes of Climate change:

1) ~~Deforestation~~:

severing deforestation

a) Removing trees that absorb CO_2

b) ~~Reduce biodiversity~~

c) ~~Disrupts water cycle~~

2) Green House Gases

a) Human activities by burning fossils fuels

b) ~~Global warming~~

3) Industrial activities:

a) Direct process Emission

b) Waste and Byproducts

4) Transportation Emissions:

- a) fossil fuel combustion
- b) Air and sea travel
- c) ~~Air pollution~~

try to write with adjective please
make it more directional

5) Agriculture Practices

- a) ~~Fertilizers~~
- b) ~~Farm machinery~~
- c) ~~crop burning~~

one word does not convey any
sense

3) Consequences of Climate Change:

- 1) Rising sea level
- a) Melting glaciers and polar ice
- b) ~~coastal flooding~~

2) Extreme Weather Events:

- a) ~~Heatwaves~~
- b) ~~Drought~~
- c) ~~floods~~
- d) ~~storm~~

u are well organized and
quite relevant

3) Impacts on Biodiversity

- a) Change in ecosystem
- b) Endangering species
- c) loss of habitat

4) Impacts on Human Health:

- a) Increased vector-borne diseases
- b) ~~Malnutrition~~
- c) Respiratory illness

4) Conclusion:
