

Global warming is a major threat to humanity. Its tremendously increasing pace is posing a severe, alarming call for the entire world. The major reason of global warming is greenhouse gas effect. It causes a barrier in the atmosphere that does not let the ultra violet radiation escape. Consequently these U-V radiations get trapped in the atmosphere. This accumulation of U-V rays causes global temperature to rise. According to statistics there has been observed about 0.4% rise in temperature globally. This is a wake up call for the entire world. Industrial waste, natural calamities and also contribute to the phenomenon of global warming. Ultimately, among the consequences of global warming, the top of the list is increasing global temperature, severe health issues like suffocation, asthma, skin cancer and eye diseases. Many organizations such as WHO, IPCC, UN are taking appropriate measures to control the causes of global warming. For instance, the sustainable development goals were made to cope up issues in which environment

You do not pose a call

Sentence structure

Exacerbation of

Ghg trap heat not radiation.

The type of radiation is not relevant

and
