

impacts on youth. produce a huge negative

Paragraph

Effects of climate change on Indian Ocean.

Climate change causes an adverse effect on littoral and as well as on island countries of Indian Ocean. Climate change contributed most extreme tropical storms, floods, drought and heat waves. Rapid population growth, rising sea levels, increasing tropical cyclone leads to higher level of vulnerability and regional insecurity. According to the report of Intergovernmental Panel on Climate Change 2021, since the 1950s, the Indian Ocean is warming faster than any other water. As a result of this, there is a warm temperature, decline fish catching which hurting the nation depend on fishing. These shows that climate change produce a more vulnerable and adverse effects on climate change.
