Q Write a detail note on landfill.
Differentiate between sanitary and industrial landfill.

Definition

landfill is special design structure
build into outtop of the ground to collect
trash and prevent them from surrounding.

landfill contain garbage, so it
may not contaminate the surrounding
especially groundwater.

Structure of landfill.

The following diagram shows the structure of landfill.

Bottom linear system.

The bottom of landfill made up high polyethylene so that leakage does not occur.

cell

The area of landfill that collect contain trash.

leachate

The landfill is designed like that bottom is slope at the point called swamp, where leachate collect.

Methane collection system

Methane is produced in landfill by the decomposition of waste in the absence of oxygen. About 50% methane is produce in landfill.

Cover

Landfill is covered so it may not in contact with oxygen.

Differentiate between Sanitary and industrial landfill.

<u>Sanitary landfill</u>	<u>Industrial landfill.</u>
it is used to collect hospital waste.	it is used to collect industrial waste.
