

Topic: Importance of data protection

Data Protection is essential to protect country and individual. Protecting data is not a new thing. In the past, kings wrote there letter in code word, to protect there secret from there enemies. Nowadays, data is not remaining in letter form, it is in digital form. However, the code words are still used to protect data from misuse. Because data is in digital form so it is also coded in digital form to protect it. Data Protection plays a significant role in protecting country or military policies. If the data of country or military is not strongly protected, enemy country or spy might misused it, which might lead to the destruction of a country or military bases. For instance, during Sindoor attack if India knows Pakistan military bases or the region where Pakistan hide it nuclear weapons, it might attack there, which leads to the death of innocent people, economy loss and destroy the sovereignty of Pakistan. And in that situation Pakistan will not be able to defend it self. So, because data is protected Pakistan can easily handled the situation and win the war. So data protection is important for country sovereignty. During, the Israel Palestinian war, Israel targeted the honourable and brave personality individual

of Iran. Israel only ~~target~~ target him, by knowing his location through the data. If his data is protected, Israel wasn't be able to kill him. In banking system, there is a dire need to protect data or transaction activities to reduce fraudulent transaction activities. Some spy or cyberattack gather the ~~dat~~ private data of individual to blackmail him or her. In most of the case the gather the data or pics and videos of female to blackmail her and to get some money from her. (288)
