Describe the effects of pollution on the environment.

Pollution not only effects the environment, but

In the early centuries, environment is not much polluted as it polluted today, which is the result of human activities on earth. The causes of environment pollution is the release of carbon dioxide (CO_2) and nitrogen gases (NO_x) in the atmosphere. The huge portion of sulphur, nitric, methane and carbon dioxide (CO_2) gases are released in the atmosphere by industries and burning of fossil fuels such as coal, oil and gas to generate electricity. These gases are not only dangerous for environment, but it also causes negative and hazardous impacts on living species. It also leads to the biggest disaster and devastating impact on the earth, which can lead to the death of species and innocent human beings. First of all, the huge amount of sulphur and nitric in atmosphere, results in water pollution. The sulphur and nitric gases are found in atmosphere, during rain these gases mix up with rain drop and ~~i~~, which results into acidic rain. Secondly, water pollution is the result of acidic rain. When the acidic rain happens in some area, it flows down towards the ocean, stream, river, lakes and ground water, and reduced or increase the pH level of a water, which causes

water pollution. Thirdly, water pollution which is the result of negatively or hazardous things. Water pollution impacts on living death of aquatic life and it also poses severe health issues in human such as cholera and water borne diseases.

Fourthly, acidic rain which is the cause of high sulphuric and nitric gases in environment, effects badly the nutrients level in soil. These acids reduce the nutrients required by plants for their proper growth and development. Agriculture sector highly suffer, due to acidic rain. Fifthly, huge amount of methane and nitrogen ^{gases} in atmosphere, makes a hole in ozone layer, the layer which protects earth from the sun hazardous rays. When this layer is damaged it is called ozone depletion, this depletion of ozone layer allows sun hazardous or high UV radiation to enter in the earth atmosphere, which causes severe health issues, such as skin cancer. Sixthly, climate change, which means high level of change in weather patterns. Climate change is also the result of environment pollution. Climate change devastatingly ~~causing~~ impacts on weather patterns and makes weather unpredictable.

Seventhly, as already mentioned in previous steps change in weather patterns. Floods is also the results of changed in weather patterns. In couple of days, Pakistan many cities such as Lahore, Islamabad, Kalarkhar and Chakwal are facing serious floods issues. During this flood some situation people face severe financial issues and this flood also causes the death of innocent people. Eighthly, environment pollution also cause the air pollution, due to highly carbon dioxide and green gases people feels difficult in breathing. Sometimes, spending maximum time in this environment or air pollution led to the severe respiratory problems. In Pakistan, Lahore and Multan cities faces air pollution and stands second or third in world biggest polluted cities. Ninthly, environment or atmospheric pollution causes mist, fog and smoke conditions in different cities. These mist and fog reduced the vision of people and also causes severe diseases in people. But due to low meters vision, multiple accidents happens and sometimes these accidents causes the death of individuals. Lastly, due to severe diseases, accidents, floods, water pollution, climate change and acidic rain people faces financial loss.

High amount of damage also causes economic losses. In conclusion, environment pollution is a single factor, which can cause multiple pollution and which results in ^{impacts} devastatingly on earth and it is species. (611)
