The future work and automation

A mind map diagram with "The future work and automation" in the center, connected to the following boxes:
- Boost Beneficial
- Let, people have more time to think more creative
- Enhance working ability
- Enhance productivity
- Perform the task efficiently or simultaneously
- More advancement in medical
- Generate Develop more Skillful job opportunities
- Future friendly
- Generate more revenue
- People will become lazy
- People will become too much dependent on it

In today's life, mostly businesses and industries depends on Artifical Intelligence or Internet of Things (Iot) based automated system. Business and industries who are not using these system currently have less sales and generate less revenue than automated businesses and industrial. So, how is it possible that in future business, industries, organization and agricultural sector will enhance their productivity without using these & automated system. In future, there will be dire need to use these automated system to boost sales and enhance productivity. There will be more benefits in future by using these automated system First of all, it will perform the task effeciently and effectvely and it

will perform these task move carefully as compared to the human being. It will also reduce labor cost by performing multiple task simultaneously, which is not possible for an individual to perform in less time. AI or Iot based works efficiently and effectively for multiple hours without being tired or exhausted, which is also not possible by a mankind. Secondly, it is cost benefical or less expensive. Because Artifical Intelligence based system perform multiple task simultaneously, without having large labor or without being tired so it will be less expensive. Thirdly, automated system letting people more freetime to live a happily life and to think something about more creative, rather than wasting their energy on same task. Fourthly, machine learning or deep learning based automated system reduces the chances of error during performing task and it will overall enhance the productivity, which will enhance the customes satisfaction and also boost sales. Fifthly, advancement in automated system will be very helpful in future to advance the knowledge of scientist, which will discover the treatment for severe disease such as Cancer. Sixthly, in future automated system will generate more skillful job opportunities, which will helpful in eradication of poverty and unemployment. Seventhly, enhance productivity and customer satisfaction, will be boost overall revenue of a business. Eightly, AI or Iot based system will be future friendly.

In future, these system will work by a single command. However, there are also some negative impacts of these automated system on future individuals. Using these automated technologies all the time will makes the individual lazy and people will become too much dependent on these system even for normal or easy task, which will also reduces their ability to think and perform so easy task. In summary, Artifical Intelligence or Internet of things (Iot) will enhance the overall productivity, generate more jobs in future and it is main goal is to makes human relax and prosper in future. But, there is also a need to balance it is use in daily life. (441)
