

EXERCISE No. 7

It is said that man's expensive adventures into space are merely the by-products of the struggle between the great powers for prestige and possible military advantage. There is some truth in this

view, but not the whole truth. Travel into space, exemplifies the same spirit of courage and curiosity which has taken man to the poles and the top of Everest, and produced the scientific miracles of this age. Poverty and disease are, in fact, being relieved more rapidly than before, thanks to the applications of science to production, transport and medicine. Space travel is one of the more striking aspects of the progress of science and it is this same progress which gives us reasonable hope of banishing poverty, ignorance and preventable disease from the earth. It is worth remembering that many of the practical advantages now enjoyed by common man from the application of science have been brought about by scientific research which seemed, when it was first attempted, as unrelated to practical benefits as the exploration of space may seem to us at present.

Questions :

1. Why does man strive to travel into space ?
2. What is the whole truth about travel into space ?
3. How have poverty and diseases been eradicated ?
4. How can we say that exploration of space would prove beneficial for us in future.
5. Suggest a suitable title for the passage.

Ex no. 7

A(1)

Man ^{strives} to travel into space is the by-product between the great powers for prestige and possible military advantage. Travel into space acquires spirit of courage and curiosity which has taken man to the poles and the top of Everest.
