

Climate Change in Pakistan

Causes and Consequences

Brainstorming

Causes

→ Emission of GHGs
(Global warming)

→ Deforestation

→ Industrial activities

→ Agricultural practices

→ Natural factors (Volcanic
eruptions, solar radiations)

Consequences

→ Increased Temperature, more
extreme weather events,
Ozone depletion

→ Air pollution, Extinction of
ecosystem

→ water pollution and scarcity of it,
respiratory diseases because of
air pollution, hazardous to aquatic
life.

→ Reduce crop yield, soil
degradation, threat to food
security

→ change in weather pattern,
Sea level changes

Also economic challenges faced by all above consequences

1. Introduction

1.1. Attention Grabber

1.2. General Statement

1.3. Thesis Statement

"Climate is essential to our lives, like spirit to the body; if climate is compromised, our survival is threatened, much as a person without a spirit may live but lacks humanity." Climate change is neither a new issue nor it is fully settled one.

Developed countries are dealing with it successfully. Whereas, developing countries are still struggling. Unfortunately, Pakistan is also one of them. The main causes behind climate change are Emission of GHGs, deforestation, Industrial activities, Agricultural practices and natural factors which leads to extreme weather events, air and water pollution, extinction of ecosystem, diseases soil degradation and economic challenges like consequences.
