Q #2

Title: Urban Green Spaces: Supporting People and the Environment

City green spaces provide rest, recreation, and a sense of community in urban areas. These places support both human and environmental health by improving air quality, reducing heat, and offering natural surroundings. Sustainable planning is essential to maintain a balance between city growth and the protection of green areas. When cities develop parks, green roofs, and tree-lined streets, they create healthier environments that support human comfort and environmental stability. Such efforts help build peaceful and sustainable urban communities.
