identification of climate change contributors.

3.4 Reforestation and Clean Energy Projects;

tree plantation, solar and wind energy

3.5 Cooperation within South Asia by Reviving

SAARC.

4. Role of NDMA.

4.1 Analyzing floods management; 2022

and 2025.

5. Conclusion

Climate change does not respect borders, mentioned by Ban Ki Moon. Climate change is a global issue which is unfortunately not restricted to the borders of any industrial developed state.

Climate change is more prominently turned in

devastating challenge for humanity in recent

history. In history, natural causes like

volcanic eruption have resulted in climate

change. However, the human resources are

major causes of climate change in present

era. The advancement of industry via Industrial Revolution is holding contiguous position in initiating this evil of climate change. Meanwhile, the challenges posed by industrial mights are equally threatening developing states like Pakistan.

In 21st century alone, Pakistan witnessed three back and forth destroying series of flooding in 2019, 2022 and 2023.

Moreover, there are other effects of climate change also witnessed like severe heatwave in start of 2023 and number of earthquakes including one in 2005. Therefore Pakistan needs vital steps to

counter these challenges. Unfortunately, there is not even a single initiatives by government which hamper the disasters and favour the management. The urge of new departments to solve such critical problems does not prove any significant step. The corruption, lack of political will and transparency invade new department soon after formation. The government with

five year tenure focuses on short cuts

to showcase their welfare and ^{to} win public. Rather the scenario in Pakistan demands permanent solution, which is difficult where climate change and management of its effects are politicized. So, the management of disasters is the need of the hour and significant for survival and growth of a state. The pertinent disaster management challenges in Pakistan are weak economy, lack of technological research, political will and intra-state collaboration. However, research and development, reforestation, clean energy projects, advanced monitoring and financial aid can help in managing disasters.
