

## TITLE: CLIMATES AND THEIR EFFECTS ON HUMAN PSYCHOLOGY

Northern Europe showcases the prime benefits of cold weather on human beings. The presence of cold acts as a hurdle and spurs individuals into action, whereas warmer temperatures result in idleness. Human beings perform optimally in cooler climates by engaging in physically taxing tasks to sustain themselves through the cold. Warmer climates, on the other hand, stimulate little motivation to spring into physical activity. This results in <sup>the</sup> body's diminished need for nutritious meals, consequently minimal effort is required to procure food. Different climates, therefore, trigger different lifestyles around the globe. Thus, reflecting a wider pattern of human nature through different seasons: idleness in warmer times and physical exertion to ensure survival in colder times.
