

Artificial Intelligence: The death of creativity

In the most advanced era where humans are so innovative that they can do wonders like scientific discoveries and advanced technology projects like ~~mod~~ robots and introducing an artificial intelligence. It is very evident that AI has been designed and introduced by a human; however, this invention has caused death of creativity in almost all the persons using artificial intelligence.

In today's era, people are so much dependent on AI that they cannot even take their daily life decisions without consulting AI specifically chatgpt. On one hand, chatgpt (AI) has helped flourish a person a lot, but on another hand, it has made a human's brain handicapped by making it rely on AI solely. In a recent case it was observed that a boy committed suicide after consulting chatgpt, which was evident from his chatbot. Students, nowadays, have lost the ability to think by themselves due to chatgpt. This has very alarming effects in near future.

It is good to use AI as it saves our time and energy from exhaustive research; but it must be assessed by an individual that how much is he relying on AI. Sole reliance on AI can have risk of losing cognitive abilities, therefore it is recommended to use AI in a manner that cannot make a person rely solely on it and allows him to use his own brain too.
