

Reforestation as a Global Urgency.

1 - Introduction

Thesis statement. Reforestation is the panacea to global climate change phenomena, as it can ameliorate effectively global warming, rising glacial melt and sea level ^{problems}, as well as, other climate change matters which are disturbing the global ecosystem.

2 - Why Reforestation is a Matter of Global Urgency

- a - Rising ^{Global} Sea level
- b - Increasing Global Temperature
- c - Changing Habitat and Ecosystems
- d - Decreasing Forest cover Globally
- e - Exacerbating Urbanization Globally
- f - Drought and wildfire becoming common
- g - Erratic Global weather-patterns
- h - Loss to Green Economy

3 - Reforestation: A Panacea to Global Change

- a - Restoration of Biodiversity
- b - Linking Reforestation Policy with climate change
- c - Higher Investment in Adaptation

d- Connecting it with Sustainable Development Goals (SDGs)

e- Ensuring Public Awareness and Education to Foster Collective Responsibility.

4- Conclusion

Not too long ago, one while travelling to Islamabad could clearly see the majestic Margalla Hills, where a dense forest cover not only provided respite to visitors, but also gave cool ecosystem to the whole city. Alas, that feature doesn't hold ^{true} for now owing to rampant Margalla Hills deforestation. The phenomenon of deforestation is a global practice and has thus become an endemic, posing grave consequence to the ^{health of} planet Earth. Hence, global reforestation is the need of hour as it is increasing global temperature, rising global sea level and is changing global habitat and ecosystem. Moreover, rampant urbanization is ~~exacerbating~~ ^{accelerating} drought and wildfire phenomena, resulting into loss of green economy. Thence, global reforestation is the only panacea to global climate change, as it will restore lost biodiversity, by connecting SDGs goal with adaptation strategies. Furthermore, public awareness

and plantation drive in education institutes can instil a collective responsibility sentiments in the young generation. In conclusion, one can concur that reforestation is the panacea to global climate change phenomena, as it can only ameliorate all problems to climate and can restore the lost global ecosystem.
