Precis CSS Paper 2018

Title: Effect of Climate on Human Energy.

In the moderate countries of northern Europe, cold climate has positive effect, as it increases human energy to face challenges. Cold temperature increases human energy because in cold season, human needs to build strong houses and arrange thick clothes, fuel from trees, food and coal. But in tropical areas, human need less exertion, as there is little need of cloths, fire, and fruits, so people remain inactive. Hence, moderate cold makes human beings more energetic.
