

PRECIS. (2012).

Aspiration fuels Revolutions.

In modern sociology, the neglect of population question remains an unpleasant symptom of absence of candor. Hence, both qualitative and quantitative measures are essential to regulate population. However, except starvation, there is no natural mechanism to curb growth. Without natural regulation methods, the increasing population growth will decrease the standards of living. If population growth increases to the extent where new births will outnumber deaths, the affected proportion of population will try to curb the growth. Yet, underworld will remain burden on resources. Resultantly, the population will be recruited unfairly by irresponsible citizens. Despite this, the population question remains insignificant for various factions of the society for their political and economic interests. They deem it inopportune. Since aspiration rather than desperation fuels revolutions, socialist calculation remains wrong.
