

Floods and its devastation in Pakistan.

2020, 2022 and now in 2025, Pakistan has to suffer with some crisis that leaves its impact on its people for months. People of Pakistan suffer and recover, but then again suffer after recovery. These short term measures ~~relaxes~~ by government ~~relaxes~~ them only for short period. Announcing cash transfers for the affected people, ~~showing~~ some speaking few words of courtesy will not lead them to the past with no climate vulnerabilities. The government has to install storage infrastructures to deal with the excess water either produced from Glacier meltdown, erratic monsoons, or India violating Indus water treaty. The loss of lives, livestock, land, electricity, food, water and health cannot be replaced without reforms. ~~Govt~~ They must have to invest in drip irrigation, resilient seed varieties, Tunnel farming to stop loss of food that reduces exports quality and quantity. Speaking of International forum, they must raise their issue of facing high climate vulnerability despite of contributing in it less than 2%. Educational Institutes must be linked with practical work on agriculture lands, teaching farmers with old and new technologies to gain their trust and enhance their interest in agriculture. Small farmers should get relief in the form of free electricity & water during emergency. To reduce climate vulnerability and its impact on economy, one's ~~most~~ government must have to be sincere and practical in following these suggestions.
