

PRECIS 2018

TITLE :

CLIMATE IMPACTS ON HUMAN ACTIVITY

PRÉCIS :

In the temperate countries, cold weather has many useful impacts. Serving as an obstacle, it helps people operationalise their energies to survive while its absence removes this impetus. Winters motivates everyone is concerned with the efforts to prepare for their survival by building houses, arranging proper clothes and heat to beat the weather. It is necessary to move quickly in such a weather and such exertion must be paid for by more food which a man must procure. However, warmer weather renders humans dull and inactive as there is no need of excessive supplies or presence of any threat. Similarly, yearly seasonal change has the same effect on oneself. People are lazy and laid back in summers but more active, mentally and physically, in the winter.
