

ASSIGNMENT

Climate Change: Causes and Consequences:

BRINSTORMING:

OUTLINE:

1. Introduction:

1.1 Hook

1.2 Background

1.3 Thesis statement: Climate change is mainly caused by many human activities

like cutting down trees, building industries, the urban growth, increasing population and farmer's activities. It affects very seriously and damage environment, weath, health problems and loss in economy and cause many global issues for all nation. Many natural reasons also play a part in climate change now.

2. Causes of Climate Change:

2.1: Industrialization

Burning coal oil and gas in factories.

Smoke and waste gases pollute air.

2.2: Agriculture

Fertilizers release greenhouse gases.

Animals release methane

Use of chemical Fertilizers.

2.3 Deforestation

Cutting trees reduce oxygen and increase CO_2 .

Forest fires release greenhouse gases.

2.4 Urbanization

More vehicles in cities release smoke and gases.

Construction release pollution.

Burning of fuel.

2.5 Population growth

More people more food, water and energy source.

More Housing

Transport Increase emission of gas.

Waste also increase environmental pollution.

2.6 Natural factors:

Volcanic eruptions.

Solar radiations

Distribution in global weather.

3. Consequences of Climate Change:

3.1 Environmental Consequences:

Glaciers are melting

Animals and plants lose their natural habitat.

Fertile land becoming barren.

3.2 Water Consequences:

Floods and heavy rains.

Storms causes destruction.

3.3 Health Consequences:

Diseases cause dengue and malaria

Malnutrition

Dehydration

3.4 Economic Consequences:

Crops (wheat) destroyed by floods

Reduction in food supply.

Roads, Houses damaged in disasters.

3.6 Global Consequences:

Rising sea level due to floods.

Many countries fight on water

4. Future Recommendations

5. Conclusions.

Overall your outline is okay

Bring brevity in your thesis statement

Avoid grammatical mistakes while mentioning

recommendations better to write them
