

Climate Change: Causes & Consequences

Brainstorming:-

Outline:-

- (i) Hook
- (ii) ~~Ess~~ Introduction
- (iii) Thesis:- Our climate is changing rapidly due to greenhouse gas emission, deforestation and Industrialization which results serious consequences like Rise in global temperature, Natural disasters and serious impacts on human health.

(1) Greenhouse gas emission:-

- (a) Emission of CO_2
- (b) Emission of Methane
- (c) Nitro oxide from fertilizers

(ii) Deforestation:-

(i) Cutting excessive amount of trees

(ii) Wild fire

(iii) Industrialization:-

~~(i) Methane from livestock~~

(i) Burning of fossil fuels

(ii) livestock farming.

(iv) Rise in global temperature

(i) 1.1°C since 19th century

(v)

Natural disasters

Unseasonal rain

Glacier melting

floods

(vi)

Impact on human health

heatstroke due to excessive

skin diseases

The essay:-

"Every phenomenon has a cause, which is invariably followed." This principle is stated by the principle of universal causation and for climate change we human beings are the cause, because of our activities earth is suffering from climate change. Earth's average temperature has risen by 1.1°C since the 19th century. Climate change is nowadays a serious issue which is rising day by day because of human activities like burning of fossil fuels, live stock, deforestation and industrialization which is having serious consequences on life like rise in global temperature, natural disasters like floods, glacier melting and unseasonal rain which is causing serious impacts on human health as well.
