

CLIMATE CHANGE CAUSES & CONSEQUENCES

“Climate change is Happening, Human is causing it, and I think this is perhaps the most Serious Environmental issue facing us.”

These words said by **Bill Nye who is an American Science Communicator & Science Educator**. Climate change is the large term increase in the Earth’s average surface temperature and the large-scale change in Global; Regional & Local level weather patterns that result from that increase caused by burning fossil fuels, deforestation, greenhouses effect, urbanization, industrialization (manufacturing goods), Agriculture practices & Live stock for producing goods and Pollution. These factors play role for making earth for inhabitation all types of species due to rising temperature including melting ice & Rising Sea level, extreme weather events in form more severe storm and floods, droughts & water scarcity, wildfires, poverty and displacement, more health risks for human and other species. Climate change is threat of 21st century because **“There is No Planet B”**.
