

Reforestation as a global urgency

Outline

Introduction

1-2) Why Reforestation as a Global urgency

(1-2) Reforestation is dire need to mitigate emission of green house gases.

(1-2) Curbing pollution to prevent diseases
① skin cancer rising issue

(1-3) Abating land utilization for the production of biofuel

(Case in point) Diesel and oil formation from starch
Brazil utilizes land for the purpose of fuel production.

(1-4) Enhancing green land for production crops

① Reduce food crisis and inflation

(1-5) Prevention from Acid rains to mitigate soil erosion and ^{to} ensure marine life safety.

(1-6) Maintaining biodiversity on the earth.
case in point (40 million cows living on the earth)

(1-8) Reforestation is necessary to reduce climate changes.

Case in point (2022 flood devastated infrastructure
and human lives)

(1-8) Preventing schools and hospitals
from destruction

(2-9) Reforestation is required to
reduce poverty.

(1-70) It is highly required to make
environment resistant to catastrophic
calamities.

(1-8)

Conclusion.

Introduction

Introduction

The earth does not belong to us but we belong to the earth. This implies that we, human beings are tremendously accountable to keep environment safe and healthy. As ^{the} most of ^{the} developing countries, particularly ^{the} South Asian countries are grappling with catastrophic climate changes from few last decades. It is stated that because these countries are more vulnerable to external changes - moreover, the increasing ~~atmo~~ urbanization and demands of food production have induced individuals towards deforestation. which has devastated atmospheric environment, leading to cause

dangerous diseases. Therefore, Reforestation is one of ^{the} major and crucial measure to combat numerous evils. Like, mitigating emission of green house gases, preventing acid rain production and maintaining biodiversity and utilization of renewable energy. In addition, Reforestation not only deters production and stopping harmful rays ~~but~~ rather also encourages to develop resilient infrastructure against catastrophic changes. Therefore chronic and vigilant measures are needed to mitigate the pressing issue.
