The Essay on climate change.

Blue sky, clean air, clear view and lash green field will be the fantacy of future generation. Pictures of Lions, elephants and Pandas will amaze them This will happen if we continue ignoring Climate change. Climate change is no more a phrophecy of doom but is a present and breathing reality, who needs to be adressed. Developed nations are dealing with it successfully while developing nations are facing challenges and in dealing with this problem. climate change is not a natural diaster rather it is man-made. It is the activities of human that cause climate change. For years, humans have taken it a light issue and continue ignoring it which had now become a monoster, who is ready to eat humans and it's ecosystem. Climate change is majorly caused by the realsing of harmful gases which piled up and harm the atmosphere.

Because of accumlation of these gases, living conditions of earth is drastically changing. These washes away the hope and life of masses and pushes the earth at brick of destructions. Climate change not only effect the life of humans but it also causes loss of biodiversity. Many animals including Lions, elephants, Pandas, sparrows and Honey bee etc. are becoming extincted or endangered. The Climate change is caused by urbanization, deforestation, Industralization and greenhouse effect. Climate change caused riase in temperature, harash wether conditions, poor Environmental condition, threate to livestock and loss of biodiversity. Therefore, it is the need of hour to focus on climate change and present initatives to solve this problems.

One of the major reasons of the climate change is urbanization. Firstly, the cities are growing in numbers as well as cities are expanding in their surrondings. As these cities expand, they expand on the green field in the surronding of cities. This expansion forces the cutting of trees and clearing fields which are an important source to keep environment

Clean- and absorption of gases like CO_2, as major factor in climate, increase in temperature. Secondly, in developing countries, urbanization is horizontal, which cause the destruction of green belt. This green belt destruction, causes in reduction of harmful gases absorbtion. These gases then accumlate to create green house effect. Green house effect leads to the trapping of heat in atmosphere and leads towards the climate risks. Lastly, In cities, infrastructure is paved. This paved infrastructure includes the Concrete struture of cities like roads, footpaths, buildings etc. Concrete and paved infrastructure trapped the heat in cities and make the hot furances, inhabitable for humans. So, the growing cities leads to the destruction of green belts and cause climate change. Besides, industralization is also the leading factor in climate change. Firstly, the rapid increase in industries causes the environmental destructions. Industries are growing rapidly and they need more places area for their factories and offices. For this purpose, forests and green belts are destroying for providing of area to industries. For example, 1.4 billion trees are cutting

every year for providing area to industries. Besides, industries also dumped their waste into environment without any recycling or removing harmful component of wastes. with the growing industry, their waste is also increasing and this waste is dumped into the environment without any scutralizations. According to a report, 9 billion tons waste is produced by industry every year and this waste, havent any plan of how to tackle with it. This waste either go to the water bodies and causes water pollution or left unchecked in environment, which causes it's surronding communities inhabitable. Furthermore, industrial waste causes the realse of harmful and posionous gases into atmosphere. Industrial waste either burned causes the realse of CO_2 alongside with other posionous gases which cause green house effect and depletion of ozone layer. or dumped into water bodies, make the water posinous. for biodiversity and er use of contaimated water aby communities around the industry outbreak the diseases

into community. In this way, industrilization causes Climate change.

Alongside, deforestation also leads to change in climate. Firstly, cutting of trees causes deforestation. Every year, trees are cutting with the increasing needs of humans. This causes the destruction of large part of forests. For example, 54.2 million hector of amazon forest { which are is the lungs of earth} has destroyed either for wood and area for industries. Around 9 % of amazon forest is destroyed by cutting of trees. This, cause the reduction in absorbtion of carbon dioxide and increase in temperature. Secondly, wild fires in

forest also causes deforestation. These wild fires not only destroyed the large part of forest but also realse large amount of CO2 into atmosphere. This realse causes the accmutation of harmful sunrays into earth and increase in temperature. This increases caused the change into

Climate and melting the of ice of earth For example, the wild fire in Los Angeles during January 7 to 31, 2025. This fires causes the loss of 50,000-57,000 acres area of forest as well as realse of 127 million metic tones of carbon dioxide into atmosphere. As a result, deforestation also leads to change in climate.

Why Aspirants fail in competitive Exams.

Fiflly, most aspirants fail in competitive examination because of digital distractions.

Firstly, because of excessive use of social media, students fail in competitive examinations. Aspirants spend most of their time in scrolling social media rather than studying. They pick their phones for searching a point or topic and got distracted by the notifications. They click on that notification and then a long chain of scrolling continues. Then they scroll without realising that their time is wasted.

Secondly, memes and reels also leads to the wasting of time of students. Students see a memes or an interesting reel while searching for study material, they start commeting, sharing and liking it. And algortims of website, show them more videos like the earlier one. And they start repeating the process without the realisation that their time is being wasting. An interesting reel or a meme can divert their focus from study to social media. And they waste their precious time without any guilt.

Lastly, excessive use of AI kills their productivity and analytical skills which are the genus to pass competative exams. While prepasing for exams, Aspirants use AI for every minor obstalce, which can be solved by a litlle attention and thinking analytically. This make them dependent on AI, which later become a hazdasous for their abilities, and they lack of basic skills which are needed for clearing compe tative exams. So, in the excessive use of social media and dependency on AI leads to the failure of aspirants in competative examination.
