

Climate Change Causes And Consequences

Introduction:

There is a saying "As you sow, So shall you reap". Which applies to climate change as reaction of human activities. For survival it is human nature, They strive for socio-economic stability. To fulfil their needs, they make choices for better sustainable future - however those choices bring some consequences with it self; Climate change is result of those choices which had been made or preferred from past - The consequences of climate change are not geographically limited to an area. Developed and Developing countries are both effected but consequence varies. Developed countries are well equipped organised enough so that they can mitigate risks. Unfortunately Pakistan is listed among Developing countries, which is struggling from climate change. The main causes behind Climate changes are volatile gas emissions, Urban development, Energy Production, Agriculture -

Practices, waste mismanagement
leading to weather events,
Impacts on health, Economic issues,
Refugees and Governance failures
The problems due to climate change
are of man made activities, they
are not naturally occurring. To
tackle the problems, it requires
Strong will, strong institutions and
transparent policies.
