

Climate change: Causes & Consequences

Introduction:-

"We are living on a planet that is slowly running a fever." Climate change is neither a new issue, nor ^P it a fully settled one. Developed nations are dealing with it successfully, where as developing nations are still struggling. Unfortunately, Pakistan is also one of ~~them~~ ^{these}. Climate change is the biggest test humanity has ever faced. Recently, in Pakistan, in 2025, intense monsoon rains and severe floods hit different provinces, causing massive destruction all over. Moreover, In 2025 the world experienced one of the warmest years on record. Extreme heat waves affected large part of Europe and other regions, resulting in heat related deaths. From September 2025, multiple tropical storms and cyclones led to severe land slides across south Asia.

These incidents shows that ~~climate change~~ ^{well good} has become one of the most serious ^{CS} global challenge. The main factors that causes climate changes are deforestation, burning of fossil fuels, rapid urbanization, waste mismanagement, pollution, global ~~warming~~, glaciers melting, soil erosion and wild life extinction.
