

Water is the verdict when warnings are ignored.

Outline:

1. Introduction:

Thesis statement: Water is a lifeline of any nation's survival in this contemporary world. It has become a needline for nations due to its importance in agriculture, in infrastructure development and energy sector. Thus, water is the verdict when warnings are ignored.

2. Understanding the phrase

3. Why water lead to disputes among nations:

3.1 Water generates clean energy worldwide.

3.2 In agriculture, water is a lifeline for food production

3.3 Fundamental source in the industrial production

3.4 Spiritual importance of water across civilizations

3.5 Fundamental source of life

3.6

Plays a vital role in infrastructure development

3.7

Protects wildlife across the globe

3.8

Pure water decides the health of any nation

3.9

Water connects the procession of nature

3.10

Lifeline for any nation's survival

4. Challenges to water security of nations:

4.1

Increasing population causes water insecurity

4.2

Politicalization of water across the globe

5. Recommendations to overcome the challenges:

5.1

Promote awareness about conservation of water

5.2

Involvement of international community resolve water related disputes

6. Conclusion

The Essay

After the independence in 1948, water from Indus river quickly became a point of contention between India and Pakistan. In those early years, President Sikander Mirza warned India that "Water is a lifeline for Pakistan, we will protect it at all costs." This historical remark shows that water not only plays a key role in nation-building but also shapes the diplomatic relations among nations.

Clean water decides the fate of nations. Countries cannot compete in economic growth without accessibility of water. Moreover, water generates clean energy across the globe. It is also a lifeline in food production. Water has extreme spiritual importance across various civilizations. Similarly, it plays a vital role in infrastructure development and protects wildlife across the globe. Water connects not only the procession of climate but also enhances nations' survival in this era of competition. In this contemporary world, water is a lifeline and

a redline for nations due to its importance in energy, agriculture and industrial sectors. Thus, water is the verdict when warnings are ignored. Water is one of the natural resources, important for the existence of life on the earth. It not only enhances economic growth but also sustains ecosystems, life and temperature of the earth. Nations across the globe are fully dependent on water. They use water for sanitation, production in agriculture and infrastructure development. Water has become the redline of nations due to its importance. This was how rightly captured by Josep Nye "Power of Nations" that "Water is an element of power." Therefore, nations across the globe fight to protect their waters due to its importance.

In this era of economic competition, water generates clean energy worldwide. It is being used to generate energy with the help of hydro plants. Water assists nations to

generate clean energy and reduce reliance on hydrocarbons. According to **UNESCO report 2024** named "**Water Security**" that nations such as China, European Union (EU) and the United States generate 60% of annual electricity from hydro power plants. Besides, nations compete to secure their waters due to its importance in generating energy. Therefore, water is the basic element of generating clean energy.

Likewise, water is a lifeline for food production in agriculture sector. Water is being supplied to farms, gardens and wetlands to produce food. Irrigation system heavily rely not only on the flows of rivers but also on flood waters. For instance, **Pakistan's agriculture** system is fully dependent on the water flows of **Indus**. Farmers across Punjab and Sindh utilise water and irrigate their crops, wheats and farms of rice, indicating water's key role in the production of food. To sum up, water is a key source of food production in the agriculture sector any nation worldwide.

In this era of globalization, water is a fundamental source of industrial production. Nations use water for heating, cooling and processing of products in the industrial sector. Countries heavily rely on water supplies to their the industrial production. This was how the World Bank 2023 report on the Indus Waters Treaty (IWT)

1960 noted that not only India but also Pakistan depends on the Indus flow to enhance industrial growth. In this context, water enhances food, textile, critical minerals and chemical production across the industrial sectors of nations. In short, water contributes to the industrial production of nations worldwide.

Similarly, water has spiritual importance across various civilizations. It has been considered spiritually important since the ancient times. Cultures, nationalities and religions still value water as the holy source of life. For instance, Gange river in India and Nile river in Egypt are considered religiously significant. In this context,

nations combat to secure their spiritual and historical connection with water. In a nutshell, water has spiritual across various regions, indicating a redline for religiously inspired nations.

Moreover, water is a fundamental source of life, leading to competitions among people to secure it. Water plays a key role to sustain the lives of humans, animals, insects and plants. It supports sanitation, food production and fulfills the requirement of every creature. This was how greatly noted by Leena Arif "In every drop of water, there is a story of life." In this context, the wisdom of Arif, indicating the importance of water in life. Therefore, water is the fundamental source of life for every creature of the world.

In this era of modernity, water is essential for infrastructural development. Nations across the world heavily rely on water in building infrastructures. They use water for mixing, heating, cooling and processing

... cements. For example, countries that construct airports, roads, runways, water ways and buildings fully rely on water. Through water, nations not only mix cement but also sustain the sanitation of infrastructure. To conclude, water plays a vital role in the development of nations infrastructure.

Furthermore, water protects wildlife across the globe. Wildlife such as plants, animals, insects and hidden species play a key role in the revenue generation of nations. The entire wildlife of nations not only depends on river flows but also relies on groundwater.

According to **World Wild Fund (WWF) report 2025**, Amazon rainforest relies heavily on rivers and floodwater, any disruption in the flow of water may cause billions of deaths in the wildlife. Thus, water protects entire wildlife of any nation, showing that any disruption may lead to war and destruction among nations.

Besides, pure water determines the health of any

nation across the globe. Water is a basic element. Clean water is essential for the survival of humans. According to World Health Organization (WHO) report 2025, that 70 million deaths were recorded since 2023-25 due contaminated water across the globe. In this context, nations resist against one another to secure their access to clean water. In short, pure water decide the health of any nation worldwide.

In this era of global warming, water connects the procession of nature. Water sustains forests and enhances the rainfall process. All these persistently maintain global temperature and seasonal change. For instance, water assists the existence of forests which act as lungs of the earth. This was how noted by World Meteorological Organization (WMO) that forests such Black Forest in Germany and Amazon absorbed 80% of the world emission annually. Thus, showing

that water is the only source of maintaining global temperature. Additionally, water is a source of lifeline of any nation's survival. Nations that do not have control over the routes of water destroy themselves. ~~water~~ not only enhances the economic, infrastructure and moral developments but also shapes their foreign policies toward others. For instance, **Egypt** despite limited military capabilities bravely fought **Israel** and the **United Kingdoms** to secure its **Suez Canal**. In this context, water is the lifeline for survival of nations across the globe. Thus, without water nations may not survive for a month.

However, there are numerous challenges that block the water security. Increasing population is one of the challenges for the water security. The world population has crossed 8 billion in 2025. Increase in population has

burdened on the flow of water.

As people are migrating to urban areas where they rely heavily on water. They not only use water for drinking, cleaning and cooling but also utilise for heating and processing in infrastructure and industrial sectors.

Thus, massive population challenges governments to maintain water supplies across regions.

Similarly, politicalization of water is a challenge for nations.

Nations who have dominance over the flow of water always exploit the weak ones. They use water for political purposes across the region.

For instance, India despite the **Indus Waters Treaty (IWT) 1960** blocks the flow of western rivers of Pakistan. In this context, nations across the globe use upper stream of rivers for political purposes. Thus, politicalization of water poses threats to water security across the globe.

However, all these challenges can be overcome through the

promotion of awareness among the masses. Governments across the globe should educate the people about the conservation of water. Through formal schooling, seminars and digital platforms, government must convince the masses about the preservation of water. Conservation culture can reduce water wastage and enable nations to manage water carefully. Therefore, the promotion of awareness about water conservation is the need of the hour.

Similarly, the involvement of international community is essential for the resolution of water disputes. International organizations such as the United Nations should take part in mediation and negotiation of water disputes. This can lead to settlement of hydro politics and enhance water justice across the globe. In this regard, the involvement of water is

essential for the water security of the entire world.

To conclude the entire discussion, it can be said that "Thousands have lived without love but none without water" (A.H. Auden).

Water is the lifeline of any nation's survival. Without water nations cannot compete in economic growth one another, showing the most significant value of water in international relations. The call for action is loud and clear. Nations should promote awareness among the masses about the conservation of water. This can enhance water management and reduce the wastage. Besides, the international community should also take part in the negotiating of water. It can lead to negotiation and reduce hydro politics. Water is a lifeline for the survival of any nation. It has become a redline due to its importance in agriculture, energy and industrial sectors. Thus, water is the verdict when warnings are ignored.
