

Essay

Topic

Global warming and our
preparation to counter it.

Outline:

A. Global warming

1. What is global warming

2. Earth is the only planet to sustain
life

3. thesis statement

B. Consequences of global warming:

1. Increasing level of global warming

2. Green house effect

3. Australia is the 1st producer

4. Melting of glaciers

5. Excessive use of chlorofluorocarbons

6. Ozone depletion

7. Deforestation

8. Industrial revolution

9. Increasing level of population

10. Revolution of machinery

C. How to counter it:

1. Renewable energy

2. Innovation of green land

3. Control of deforestation

4. Ban on using CFCs

5. Planting new trees

D. Conclusion

The earth is the only planet which sustain life. It has the favourable physical condition of life. Billions of years have passed. The human beings are using its natural resources. But now there is an alarming situation which is called global warming. The earth temperature is increasing day by day.

There are some factors which are causing global warming.

According to recent NASA analysis the earth temperature has increased 1.62 Fahrenheit to 0.9 Fahrenheit which is an alarm bells to the Scientific Society ~~and~~ in general and political community in particular.

Further more, As the 21st century started the revolution of factories step in. The factories consumes energy. when it evaporates it pollutes environment.

very badly. The excessive exposure of the gases is the main cause of the ozone depletion. Most of the machines are using chlorofluoro carbon as their main element. But there is an unaware thing that how much it is dangerous for our environment as well as for the ozone layer. It is the natural barrier of earth which protects the earth from the ultra violet radiation which is coming through the sun. But now this layer become damage due to excessive usage of CFCs. In addition, the trees are the natural resources of maintaining the earth temperature. The deforestation is considered as the main source of global warming. As the human population is increasing, the deforestation is also increasing. Moreover, deforestation is considered as the main reason of melting of glaciers. The Glacier National Park in Montana had 150

glaciers in the late 1800, but
now it has only 26 left. In
short, deforestation is causing
global warming - than any other
human activity.
