

Artificial Intelligence phobia is based on lack of knowledge.

Outline:

Thesis statement: lack of knowledge leads to misconception about artificial intelligence. In the world, most of the societies and communities do not understand the meaning and purpose of artificial intelligence truly. So, it does not mean that if people do not know anything then that thing is harmful.

How lack of knowledges leads to Artificial intelligence phobia.

Lack of knowledge do not mean that Artificial intelligence is bad (Thesis)

a) People do not have knowledge about the usage of Artificial intelligence based machines.

b) Uneducated people are unaware about true meaning of AI bots on website.

c) Mostly people thing that chatgpt is just a waste of time.

d) People feel fear about the use of AI based software and tools.

e) Due to unawareness, people are not able to use AI for their ease.

Not only lack of knowledge but also there are many factors which lead to the AI phobia (Anti-synthesis)

- a) People have knowledge, but due to security threat, they do not use AI
- b) Artificial intelligence based bots are the bases are personal data leakage.
- c) People think that chatgpt has google copy paste material that's they do not use it
- d) In third world countries, people mostly prefer manual working not AI based
- e) Due to lack of interest people do not use AI.

Despite some other reason, main purpose of AI phobia is lack of knowledge mostly (superstition)

- a) In Pakistan illeracy rate is high that's why people have no knowledge about AI
- b) AI bots are the part of security not the part of data leakage
- c) Chatgpt is machine learning based platform unaware people think that it is no more than just copy paste material.
- d) People are unaware that's why they prefer to go for ~~man~~ manual working.
- e) People do not use AI because they do not believe in science. They believe in their superstitious misconceptions and crisis situations.

Awareness is a key to success. If any nation does not have knowledge about science and technology then it will not be in their favour. Many developed countries like Japan, US, UK, China and Russia use their knowledge to innovate and explore the secret of the world while third world countries are still in misunderstand and misconceptions. Japan have the best AI based technology in the world because they know better than us that how to use their book based knowledge into the practical life for human welfare. Technology can be use in good and bad situation to make real change. It can be use in good to better our some current condition. Elon musk companies like Tesla, SpaceX etc are the result of true use of knowledge and Artificial Intelligence. Developed countries are more successful than third world countries because they believe in science and technology not in superstitious misconceptions like us.

One upon a time there are three brothers who wants to cross the river. Elder brother has no knowledge and he manually crossed it by making his life in risk. The ~~see~~

Second brother with few knowledge make a boat and cross the river. In making boat he wastes his time while the younger brother has well knowledge about ups and downs of river so, on the basis of his knowledge he easily passed the river about any hurdle.

So, basically knowledge makes a real difference about way of problem solving in a safe way. Therefore, lack of knowledge leads to misconception about Artificial Intelligence. In the world, most of the societies and communities do not understand the meaning and purpose of artificial intelligence truly. So, it does not mean that if people do not know any thing then that thing is harmful. In Pakistan, illeracy rate is very high due to which people are unaware about the blessing of Artificial Intelligence and they make excuses about it. People feel fear about the use of artificial intelligence based softwares and tools that's why most of them do not use chatgpt. All of these stuff leads to not proper use of AI base technology. People think that

if they use AI then they will face security threat like data leakage through bots. People satisfy with manual working that why they think that chatgpt is just copy pasted material platform. In short people have no interest in AI. In Pakistan illiteracy is the main cause of AI phobia. chatgpt is not copy pasted platform, it is machine learning based platform. People do not believe in science and technology that's why they think that bots are the source of data leakage but in reality these are the source of security.

In developing countries people mostly faced the problem of unawareness about the use of AI in their daily life. Today we have many online AI based platform, but most of the people do not use them because they do not have knowledge about the use of these platform. Today we have online services such as Careem, One drive, food panda etc but people do not feel comfortable with them. All of this stuff make our life complicated not easy. We need to introduce AI as a field in Pakistan.

to awaren the people about the blessing of AI. In this way, lack of knowledge is the source of misconception about AI phobia.

In Pakistan, illiteracy ratio is very high. Most of the children do not go for the education. According to Plato "knowledge is the power which make the person to desire right thing." In capital territory of Islamabad, there are almost 70,000 children are out of school. (Federal Ministry of Education, 2023). So, if our youth will not educated then, we cannot able to well known about the use of Artificial Intelligence in our daily life. That is how the illiteracy and lack of knowledge make us aware about the use of AI.

Chatgpt is a platform which helps every person to get answers of their queries in an organized way. People thing think that the use of chatgpt is the waste of time and they can easily search better material on google whereas, in google it takes time to find out useful

material in an organized way in a short period of time. So, actually chatgpt is AI based machine learning platform which answers once query quickly. In short chatgpt is ~~not~~ the waste of time whereas, google is the waste of time.

People feel fears about the use of AI based softwares and tools. Some software need some permissions regarding an access to document, picture etc because they need it. These permissions are necessary for a software to make your work easy. For example pdf viewer is a software which required an access to your documents. If you do not grant permission to that software then how will it able to open it. So we feel fear because we do not have knowledge about the permissions main purposes. In this way, we always fear about softwares which are based on AI.

Awareness is not a solution of any problem. If one person is aware about the purpose of any thing, then it is the fault of that person. Even

In 21st century, under developing countries are not able to understand AI as a teaching field. They think that it is a monster who leak their personal data. People are not easy to use them AI based technology for example chatgpt, AI based cars etc. In western world, people are not feeling comfortable to use AI based car because they feel fear that it can lead to an accident. People need to understand the true meaning of AI. In this way, people avoid the use of ~~AI~~ AI based technology.

In Developed countries, people have knowledge about the use of AI based software, tools and technology but they think that their personal data can be leaked through it. Different hackers use AI based platform for money purposes. In 2020, the case was reported that one hacker robbed millions of American dollar through of America and transferred it to the Palestinians. It was the biggest robbery of the world. So, the personal data and organizations

data can be leaked through the use of AI based technologies. In this way, AI working as a security thread.

Artificial intelligence based bots on search engines are the main source of data leakage. When these bots get person's personal information then it can be used by criminals in dark web for blackmailing purposes. People without any concern allow different websites to send notifications. This step also leads to data leakage because some notifications are used to introduce virus in our device which ultimately leads to mobile, laptop, personal computer etc hacking. So one may easily understand that how AI based bots on search engines are the main and basic source of data leakage.

ChatGPT is a platform which has material of Google. It means that it is copy pasted material. People rely on ChatGPT for their work. That's why they became lazy. America earned ~~million~~ and trillions of dollars.

through AI and faced approximately 70% unemployment due to AI (Daron, Destruction of AI in America, Jan 2023). Because of this situation, Italy became the 1st country among these countries which ban chatgpt. In this way, chatgpt is the main source of unemployment and has bad consequences in human life.

In third world countries, mostly people like to do their work manually because they will comfortable and satisfy with it. People, especially female like to do manual work. They do not use AI technology based websites and tools for this shopping purposes. Females like to go to the market in which they can easily bargain with shop keeper to ~~their~~ set their deal. Females think that they can get better and cheaper dresses, cosmetics, shoes etc through manual shopping not through only. In this way, one can easily understand the traditional and manual way of working is more comfortable for the people living

In third world countries.

Due to lack of interest, people do not use AI. They feel that it is boring to do their work at home. According to Aristotle "human is a social animal who makes relations". Through AI based technology, socialization of a person is compromised. People do not have face to face contact with each other. So, they feel it boring. People need a physical change in their life that's why they go different place to do their work and they enjoyed it. Due to AI, socialization process has slowed down which is against human nature. In this way, one may see that how people do not have interest in AI.

There are several reasons of unawareness in Pakistan but illiteracy is one of the major source among them. In Pakistan, we have high illiteracy rate. Almost 60-70% of childrens are out of school in Pakistan (Dawn, Education in Pakistan, 2021). Due to high illiteracy rate, the

Pakistani communities are unaware about blessing of AI. If people are unaware, it does not mean that AI is bad thing. We need to educate them about the importance and significance of the use of AI. In this way, illiteracy leads to lack of knowledge about AI.

Despite some weaknesses, AI bots are the source of security to secure personal data. These are not the source of data leakage. All evil actions were done by the human, not by the AI based machines, from the history to the present day. Bots are used for the security purposes, if someone uses them for wrong purposes, then it is a fault of that person. We cannot blame machine for it which is non-living in nature. The use of machine is dependent upon the person. In a nutshell, bots are the source of cybersecurity.

Most of the people think that ChatGPT has copy-pasted material of Google, which is the sign of...

unawareness among them. An educated person easily understands that the chatgpt is the AI based machine learning platform. This software learns different things with the passage of time itself based on the query. This software learns more and more things when someone interacts with it regarding some problem solving method or query. The people who do not want awareness then they prefer misconceptions and give them priority. So AI based chatgpt is not copy pasted it is AI based machine learning software.

People who do not aware about the proper use of AI prefer to go for a manual work. Illiteracy is high in Pakistan that's they even do not know the true meaning of AI. They ~~sp~~ spent their life lives in misconceptions and delimitas. They like to live in illusion. They do not prefer online job, AI base Holographic online meetings etc. that's why they do not give any importance to - understand it.

Physical job needs more hardwork as compared to online jobs but in a traditional societies like in Pakistan, it is not easy to make change. In this way, people prefer manual jobs as compared to online jobs in Pakistan.

In Pakistan and other third world countries, people are solving the problem of superstitions. They do not have any interest in innovations like science and technologies. The third world countries are facing the crisis situations that is why they have no interest to understand AI as a field. Pakistan's economy is at the growth of 0.4% in the FY 2023 (IMF, 2023). So in these crisis situations, people have no time to understand the importance of AI. In this way we can see that superstitions and crisis are the main problems of developing countries.

In a nutshell, one may say that Artificial Intelligence works for human welfare not for human destruction. We need to aware people about the importance of AI by giving it the level of an special field. We need to introduced AI as a field in Pakistan. We need to open research centers for AI learning. Career counselling programs should be introduced to educate people. Online programs should be started to aware common people about AI. Government can make crucial and significant role in this regard. We need to make use of AI based devices in our daily of routine. Inspite of some negative inputs, AI has played important role for human welfare. AI is a key to progress, prosperity and development. If Pakistan works hard in this field then we will ~~not~~ be a Superpower one day like USA and Russia.
