

Despite its urgency, climate crisis remains the most neglected cause.

Outline

1- Introduction

Thesis Statement

2- Factors which cause climate crisis

a- Human activities are deteriorating the environment

b- more carbon emission and carbon trading

c- Displacement of population and its explosion

3- Major reasons for negligence

a- Race among nations for being global hegemon

b- Not paying heed on climate variations

c- Lack of global unity

4- Urgent needs of addressing the climate crisis

a- More concern for environmental changes rather than being hegemon concerns

b- United efforts are necessary for mitigation

c- Creating a sense of responsibility among nations

5- Conclusion

Climate crisis has become most concerning issue around the globe. It can cause deteriorating effect on the whole world. Various factors including natural and most abundantly, human activities are responsible for environmental change. Though people are more civilized now but their concern relating to climate is very small. Their agricultural and specifically industrial revolutions have damaged the natural climate. Now enhanced carbon emission and carbon trading are the causes of climate crisis. Moreover, many people are shifting towards urban areas, causing a massive disruption in daily activities and hence polluting the environment. Many countries are making efforts

for the economy boost by consuming more and more energy. They are in a race of global hegemony. Then neglecting the important issue of climate. As the various countries are making their own blocs and so lack of unity among globe. Some measures are necessary on urgent bases to mitigate the global concern. All the countries are bound to take responsibility of this global issue.

Climate is the variation in weather of an area or region for a specific long time. Climate is not same all around the world. Some regions and continents are covered with ice and too cold such as Antarctica. While some regions comprises of plains and deserts and hot in nature like Africa continent. But, change in climate is not a problem, climate crisis is the reason. Climate crisis occurs when its regulation paper gets disrupted either by natural phenomenon or human activities. In climate crisis some natural hazards, disasters and global warming is involved. Most of the time, human activities are responsible for the crisis.

Many human activities are the major cause of this global concern. Like industrial technological advancements have caused the rising of global temperature. It has disrupted the environment due to the consumption of coal and other fossil fuels. By the burning of these fossil fuels carbon is emitted in the atmosphere. So the toxic gases are accumulated there. As a result they mix with water vapours causing the acid rain. This acid rain can increase the acidity of soil and most of the heavy metals such as lead

mercury, arsenic and zinc are leached into the soil. Ultimately causing the land pollution and water pollution.

As the carbon emission is increased after the industrial revolution in mid seventeenth century, this led the world on the roads of environmental destruction. Most of the carbon emission is due to chlorofluorocarbons which are used in refrigerators, air conditioners and aerosol sprays. These particles go into the stratosphere - a layer of atmosphere - and cause the decomposition of ozone. These activated oxygen molecule and the free radicals produced here become a source of ozone layer depletion. This ozone layer filters the harmful radiations - ultraviolet radiations - coming from the sun, reaching to the surface of earth. If these radiations fall on the humans, these can cause skin cancers and other skin relating disease which are most harmful for the human beings.

One other major cause of climate crisis is the population explosion and its displacement from rural to the urban areas. People in rural areas are not provided with basic facilities of health and education. There are very few opportunities of progress and well-being of poor masses. So these people move from these areas and start their settlements into cities. Thus this displacement of people affects the environment in many ways. As the population in cities are shifting continuously,

thus enhancing the traffic and noise pollution, which ultimately polluting the environment.

The negligence in climate crisis can lead towards detrimental circumstances. Most of the countries are not paying proper attention and care towards environmental change because of their own activities. Every country is consuming the energy and fossil fuels for the enhancement of its economy to fulfill the purpose of global hegemony. Many countries are in this race. China, India and USA are major consumers of energy to fulfill their energy demands. These are contributing into the deterioration of environment like a Damocles' sword.

Many agreements and treaties have been signed by various countries for the preservation of nature after the serious impacts of industrial revolution on human environment. Many environmental activists have written books and articles for the awakening of public awareness. Conference of Parties (COP) is the global platform for the global environment concerns. Many efforts have been made to overcome the losses caused by environmental change. But due to personal and national interests of every country, all the countries are not sincere in this regard. Such as President Donald Trump had put out his country from Paris agreement by neglecting the environmental concerns.

Most of the Western countries are making their own blocs for the security, political and economic and

Social and cultural developments. These blocs do not agree on the same agenda adopted by the other countries. So, a lack of unity appears in the implementation of global agreements and treaties on the climate issues such as Montreal and Kyoto protocol cannot succeed due to their non-binding nature and lack of unification. Some developed countries prefer their national interest over global interests and thus fail in achieving the progress by leaps and bound in environment conserving areas.

To avoid these damages and losses to the environment, all the countries are bound to make coordination and cooperation for resolving this global issues. Sincere efforts from every country are vital in this regard. Major industrially developed countries like USA, China and Western countries should help the under-developing countries to achieve this whopping purpose. They should focus on environmental issues more despite on their efforts of being global hegemon. Every individual, every institution, every community, every country should make efforts to mitigate these climate crisis.

In conclusion, climate crisis is major global issue which can be mitigated by adopting some fruitful bearing actions and efforts. Every country should wary and careful relating to the increasing environmental concerns. If these environmental issues are left without proper attention, these can deteriorate the

environment. So the preservation of environment is a global responsibility. Without achieving these goals and responsibilities, we cannot protect our environment and ultimately our universe. Sincere and heedful efforts are necessary in this regard.
