

Climate change: Causes and Consequences

Outline

1) Introduction:-

- i) Hook
- ii) General statements
- iii) Thesis statement:- Climate change is a global issue which is caused by human as well as natural causes and it leads to serious consequences on temperature, health, agriculture and tourism.

2) Causes of climate change:-

A) Natural Causes

- i) Volcanic eruption
- ii) Solar radiations
- iii) Orbital changes

B) Human-derived Causes:-

- i) changes in agriculture
- ii) Heavy transportation
- iii) Greater rate of deforestation

iv) Smoke evolving industries

3) Consequences of climate change :-

- i) Weather extremities
 - a) High temperature
 - b) Less humidity
- ii) Greater risk of natural disasters
 - a) Floods
 - b) Droughts
 - c) Wild fire
- iii) Health and education sectors
- iv) Agriculture
- v) Tourism

4) Conclusion

Beginning with the saying of Bill Nye, "Climate change is happening, humans are causing it, and I think this is perhaps the most serious environmental issue facing us." Climate change refers to long-term shifts in temperatures and weather patterns. The weather can change from hour-to-hour, day-to-day, month-to-month or even year-to-year. The shifts may be natural, but since 1800s, human activities have been the main drivers of climate change, according to the United Nations. Climate change is a global issue which is caused by various factors including natural and humans as well, and it is leading to various drastic effects on temperature, health, agriculture and tourism sector.
