:Essay mock:

Topic:

" Unethical use of AI tools
in education and its consequences"

:Outlines:

1- Introduction

2- How AI tools work in education
   and other departments:

3- Unethical use of AI in education

    a- AI replace human educators

    b- Use of different Algorithms
   that is unnecessary for
   education.

    c- Increase in automation of
   education sector.

    d- Digital divide by favoring
   students with technology
   access.

    e- Reducing education to
   mere transactional
   process.

    f- de-humanization of
   learning experience.

4- Consequences for the Use of AI tools in education:

a- Increase in use of AI tools in education sector produce threat for the teachers to loose their jobs.

b- Stress and personality disorder increases in students.

c- Use of technology is dangerous for the physical health of students.

d- Increase of AI tools may reduce the practical work for students.

e- Economic loss for educational institutions: infrastructure and furniture etc.

5- Conclusion:

Essay

Artificial Intelligence is a machine based Intelligence that is used in computer systems and the major quality is that it can react, sense the data and act like human Intelligence. Artificial intelligence was first discovered in 1960s and nowadays the use of AI in almost every department has been increased and In Pakistan, mostly government and private sectors work on Artificial Intelligence. The use of Artificial intelligence tools in education sector has also been increased and as we already know every coin has two faces. So, the same as happened with education sector. and not in education sector almost every sector is facing the unethical use of these tools.

In education sector, the artificial intelligence use for the betterment of students and for the management of work-load balance of teachers. And the AI tools enalize different datas that is useful for students and present this data to students automatically. But the artificial intelligence tools . unfortunately begin to use for unethical purposes as it increases risk for teachers and parents of students. So, artificial intelligence is being used by other departments for their increase in productivity, automation, data analyzation which increase the innovation in their products. and their buisness becomes more profitable. Here we discuss how artificial intelligence tools is being used unethically in educational sector.

Firstly, artificial intelligence is now used for creating the AI featured characters which can be developed in computer softwares and by using AI tools. these characters talk, move and express all the input which was given to them by AI tools. And nowadays educational sector is moving towards these types of lectures that provided to students. And that is a huge threat for teachers who solely depend on their teaching income and after this, they all become unemployed and an economic division spread all around the society.

The other main unethical use of Artificial intelligence in education sector is the use of unnecessary

algorithms analyzing that is
analyzed by AI tools. As we
discussed above, the world is
moving fastly towards AI
advancement and AI tools analyze
the lectures and notes for students
by analysing data. Artificial
intelligence may analyse that
algorithms for students which
is unnecessary for them and
they may be unable to
understand that and that is
a major glitch in artificial
intelligence tools.

Further more, the
unethical use of Artificial
intelligence tools in education is
that the automation is increased
in this sector. As we have
seen many times that the
students during online classes
use different softwares which

can store your previous activity and the next day, the same activity displaced which is unable to recognize for the newly ~~under~~ trained person. And the students busy in their own unnecessary activities instead of studying.

Adding more to that the use of AI tools, digitally divide the student with technology access. It is fact that many student have not internet acesse and even they do not have their cell phones and that will create gap between them. Those student who have all the facilities, may learn their lesson through AI tools and those who have not all the facilities may lack with education. This is a serious issue which needed to be

addressed at governmental level and find solution.

Another, last but not the least, the dehumanization increases in education sector. All the important task is being performed by automation and the involvement of humans decreased.

Now, we can talk about the consequences of these unethical uses of AI tools in education sector.

Firstly, as we talked above, the increase in AI tools may increase the risk of job for teachers and those who have spent their 16 to 17 years in getting education and trained themselves form their childhood to become teacher, now going to be unemployed. But, the point of

thought here for teachers, that it
is the responsibility of them all to
upgrade themselves according to the
circumstances. Because if they want
to survive in this sector, they have
to learn how to use these AI tools
and how these tools become
beneficial for sthemselves and students
as well.

The another main consequence
of the use of AI tools is that
the increase of stress and personality
disorder has been observed. when
students gets free hands from
their parents to use AI tools for
educational purpose in their devices
like mobile phones, laptops, tablets etc.
They not only use that, they
get addicted to social media
usage and get introduced with
gaming industry. And here, the
major mistake happened by their parents

that they donot keep an eye on them,
By providing these devices to them, they
get involved in their daily activities
and does not question their child
Due to these, the stress has been
increased in students and they
now have many many personality
disorders.

Another, same like the
above one is that the excessive
use of technology is dangerous
for their physical heath also. Because
the child have internet access all the
day and he did not perform
any physical task and not involved
in physical sports activity and
remained all the day in the bed and
this thing cause the child become
sycho and started doing abnormal
activities and even suicide. In
previous years, an @incident reported
in newspaper that, the 14 year

child suicide because of the excess of gaming and at that time a new whale game was introduced which cause many death casualities

Adding Further to the consequences, the increase of AI tool decrease the practical work. As the students have excess these tools to their beds and study tables, so they donot like to go outside and perform practical work of what they have learned. Practical work is very important for any student because the practical work enable the student to easily understand the topic and later help in their practical or job life.

Another major consequence of AI tools is that the owners of educational institutions went to economic loss because when the students have the

access of technology to their homes, they will not come to these institution physically and this will not acceptable for institute owner because he have staff for the stability of institution and their staff will become unemployed and more to that the school owner have invested a lot in furniture and educational tools and when students will not come to school, he'll get Economic loss.

To conclude all this discussion, we come to an end point and that is every technology in every department have both benefits and threats, we need for legislation and regulation of these types of tools, so that in future every one gets benefit from it and not anyone have threat issues from these types of tools and technologies.
