

# The Environment Has Gone Beyond the Tipping Point now

## Outline

1- Introduction

2- Explaining the concept of Environmental Tipping Point

3- Why the Environment has gone beyond the tipping point now:

A- Rise of industrial activities

B- Acceleration of nuclear weapons

B- Burning of fossil fuels at high level

D- Masses' unawareness regarding environmental concerns

E- High level of deforestation

4- Threats Due to Environmental Tipping Point:

A- Heat up of average temperature

B- Spread of diseases due to Pollution

Damage of economy by floods

Huge challenge for new generation

activities

in manufacturing

Order these points in the sequence of their severity.

Diversify vocabulary for these headings

2

Prevalence of food insecurity at global level

5-

Prescriptions to make ~~good~~ and suitable environment for human beings

A-

global sincerity an environmental issues

B-

minimum use of non-renewable energy resources

C-

Positive role of media about clean environment worth

D-

Individual efforts to clean the environment

E-

Absolute global peace regarding weapon usage

6-

Conclusion

According to Aristotle, human beings are social animals; it refers that a person cannot live alone. In ancient time, human beings used to live ~~living~~ alone, but with the passage of time they started living together ~~live~~ together. When some people started living together, they created a society.

All things which surround the society ~~is~~ is called environment. Any kind of change in environment is related to human beings or natural changing. With the passage of time, human beings started new creations and innovation which affected environment as well. A high level of changing of environment was seen after industrial revolution.

Similarly, this changing state steered environment to tipping

②

Point. Now, the environment has gone beyond the tipping Point. The tipping Point of environment may <sup>lead</sup> further leads to various repercussion in different forms. Industrial revolution, nuclear weapon and burning of fossil fuels at high level are the main factors which lead environment to tipping point. On the other hand, global warming, food insecurity and new diseases are the major threats of environmental tipping point. Global sincerity on environmental issues, move to renewable energy resources and world peace are the suitable prescriptions for good environment. Hence, it proves that environment has gone beyond the tipping point with same causes, and that can create big problems. However, some good can maintain it for human

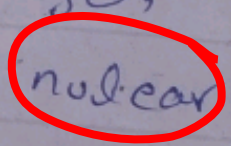

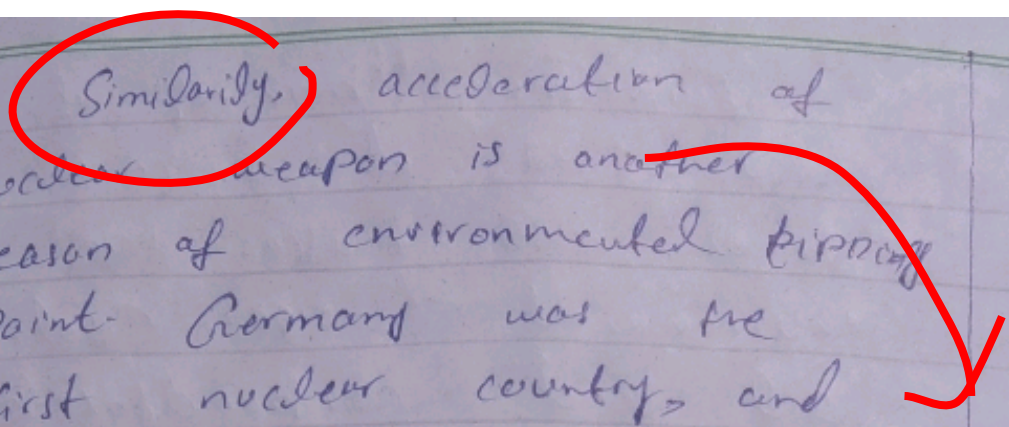

Allah almighty has made the whole universe and human beings. Human beings create society and state. Everything around the society includes environment. The creation and any activity of a human being is linked with environment. So, the human beings and environment are correlated. Therefore, for a balanced and good life of human beings, environment must be suitable. Human beings have made environment worse and now it has become uncertain. The uncertainty of environment is called tipping point. Tipping points may lead to further bad upshots. Then, it proved that environment has gone beyond the tipping point. It has become a big challenge for human beings due to its own activity.

Tipping point is a point of no return. Irreversible damage.

To begin with, rise in industrial work is a major factor which ~~co-~~brings brought environment to its tipping point. Changing and uncertainty of environment started from industrial revolution and now it has become tipping point. Most ~~the~~ <sup>western</sup> world countries started industrial work in 19th century. Capitalism is the first economic way that is starting point of industry. Similarly, other countries started industrial work with huge combustion of energy and green house gases effect. Now, average temperature has reached at near the ~~to~~ two degree which is harmful. Thus, it exhibits that rise in industrial work is a major factor of environmental tipping points.

Similarly, acceleration of nuclear weapon is another reason of environmental tipping point. Germany was the first nuclear country, and now there are eight countries which have nuclear power. Race between countries about <sup>among</sup> weaponization is a major factor behind environment bad conditions. A huge weapon destruction in wars make environment very worse. The example of Israel and Palestine ~~were~~ war elaborates the whole situation. It will further destroy balanced environment in near future. So, nuclear weaponization and race is also fact behind environment

Poor argument

Furthermore, fossil fuels at this level also makes the environment worse. Coal, oil and carbon dioxide are the most major fossil fuels.

The Combustion of fossil fuels at high level of fossil fuels change the environmental condition and make it very bad.

A high level of gases has made the natural air and it is becoming harmful.

Due to fossil fuel burning, smog can be seen in different countries.

Thus, it is indicated that fossil fuels are also a problem for environment.

Moreover masses are unawareness  
is the big issue for  
good environment. In  
developing countries majority  
of people are unaware  
from the environmental  
concerns. They are completely  
ignorant from the importance  
of clean environment.

This ignorance and insecurity  
leads to environmental  
tipping point. Pakistan  
and other developing  
countries are vulnerable  
from environmental issues.

For example, Pakistan  
has lost huge economy  
portion in 2022 flood.

Thus, it shows that  
the people ignorance  
is another reason  
behind environmental  
tipping point.

## Aforementioned discussion

~~Aforementioned~~ discussion explained the factors which are responsible for the tipping point of environmental conditions. However, upcoming paragraphs will indicate the outcomes of environmental tipping point.

First and foremost impact of ~~more~~ environment is heat-up of average temperature. Normal temperature is suitable for human beings. Due to global warming and weather uncertainty, temperature has reached at high level. A huge wave of heat was seen through out the world in 2023. Facts shows that 2023 was the hottest year of world which brought high heat. So, it can be said that environmental uncertainty

is threat for human beings  
in high temperature form.

Likewise, maximum diseases  
are spreading due to weather  
tipping point. In floods,  
wildfires and droughts, maximum  
new diseases can be seen  
around the world. High  
pollution in land, air and  
water create various diseases.

For examples, different viruses  
and symptoms show that  
the environmental condition  
is not good and it  
is creating threats for  
human beings. So all  
factors and reasons  
steer to new kind of  
disease which shows  
that the environment has  
gone beyond the tipping  
point.

12

Last but not least, tipping point of environment is also a threat for upcoming generations.

In past, some scientists were denied the threat of environment. Recent situation has proved that environmental issues were neglected in past.

The uncertainty of weather and risk of environment is a big challenge for future generations. The example of 2030 when temperature will reach of 2° scale entails the uncertainty of environment. So, the argument lead to more challenge and problems for upcoming generation.

These paragraphs glanced the impacts of environmental tipping point; coming point

(3)  
will be prescription of  
good environment.

Firstly, global sincerity  
is required on environmental  
issues is imperative. All  
developed and developing  
countries must have  
proper steps to  
solve this issue. There  
are some agreements and  
treaties on environmental  
issues, but it is still  
unsolvable and becoming  
threat. The uncertainty  
of environment shows  
that the world is  
still not sincere  
on environmental issues.  
A good step and sincere  
implication may lead  
to environment good  
and balanced.

(a)

So secondly looking forward  
to renewable energy resources  
is another good step. Though  
some countries like China  
and Japan have **taken** good  
steps toward renewable  
resources, but **these** steps  
are **not** enough. From society  
to a state, individual  
and collective effort  
is required for environmental  
issues. In specific conditions,  
Pakistan and other  
developing countries must  
adopt renewable resources  
which make their environment  
clean and balanced.

Positive campaign  
of media ~~is~~ on global  
peace is a ~~very~~ major  
step to decrease the  
environmental threats. A  
huge level of nuclear  
weapon destruction

environmental tipping point.  
Media Positive role  
in any matter can  
bring beneficial impacts.  
On the other hand,  
weapon destruction and  
nuclear testing steering  
to environmental tipping  
Point. Thus, it shows  
that media awareness  
on global peace is  
a suitable step for  
clean and good environment.

In summation, it  
can be said that  
the creativity of human  
beings has led to  
environment to tipping  
point; where it is  
threat. However, some  
good steps may  
eliminate the upcoming

threats. In nature, environment  
 is so clean and good.  
 With the passage of time,  
 human beings activity  
 has changed its shape  
 and now ~~it's~~ been it  
 has become at tipping  
 point where it is the  
 threat masses ~~are~~ unawareness  
 and high level of  
~~deforestation~~ are major  
~~problems~~ while economy  
 damage and human  
 being lost are main  
 impacts. Meanwhile,  
 absolute global peace  
 and sincerity of global  
 world may be good  
 prescription. Human beings  
 have to think sincerely  
 about environment. From  
~~it~~ individual to collective  
 efforts is only solution for  
 clean and suitable environment  
 which is required for good life.

Multiple grammatical and spelling errors.  
 Overall structure of essay is generally ok.  
 Content needs a little improvement. Avoid  
 cutting.
