

Implications of climate change for children in developing countries

Thesis statement:

Unfortunately, climate change is more hostile for children's health, nutrition education and future in developing countries.

Introduction:

Climate change became the biggest global threat of the 21st century. If it is not addressed adequately, it will have more dangerous implications for developing countries, especially their children. They face malnutrition, economic disruption and more threats of infectious and parasitic diseases. Moreover, developing countries often have limited social safety nets, widespread poverty, fragile health care systems and weak government institutions, making it harder for them to adapt and respond to climate change. They have limited resources and their children, in that circumstance, already face severe challenges which climate change will likely exacerbate. In this way, in this circumstance, unfortunately, children of developing countries face

more adverse impact of climate change.

Outline

1. Introduction

2. Implications of climate change for children:-

2.1. Climate change more hostile for ~~social~~ social development.

2.2 high risk of diseases and malnutrition

2.3 higher risk for heat related illness

2.4 Poor pregnancy issues

2.5 Displacement and their ^{Poor} cognitive development

2.6 loss of crops and food shortage

2.7 Extreme event destroy school, child care center, infrastructure critical to children's well being.

3. Conclusion
