

Artificial Intelligence can be the saviour of human race.

Argumentative essay;

yes

Introduction:

Crunch Paragraph:-

Outline:-

Thesis

1) Awareness about any disease becomes easy through AI.

2) AI played an important role in the education during COVID-19 pandemics.

3) AI solves the problems easily that is related with the economy.

Antithesis

1) Negativity is also spread through AI.

2) Learning through a virtual classrooms lack a physical lessons.

Cognitive abilities was decreasing due to the rapid use of AI.

Synthesis

1) An efficient use of AI creates awareness in the human life despite of negativity.

2) The learning abilities of a student does not depend on the mode.

Economics problems are just like the tough nut to crack. With the help of AI. it is easy to crack the nut.

Thesis

4) The emerging technology of AI is just like the magic.

5) AI is used the best tool in the disaster management.

Antithesis

4) AI creates the barrier in the physical education.

5) Pakistan is not ready to invest the money in the emerging technology programs.

Synthesis

4) AI cannot replace the communication skills.

5) Punitive action takes time, Pakistan will invest the money in the emerging technology programs.

ESSAY:

Artificial Intelligence can be the saviour of human race.

An efficient use of artificial intelligence can be the saviour of human race. An artificial intelligence is increasing very speedily in the 21st century. There are many sectors which effects by this such as education, economics and many more. Any emerging technology can be the saviour of human race; when it is use in accurate manner. Any advanced technology is like a magic. The sparking light of magic spread very speedily. So, just like the light of the magic. An AI sparks a very beautiful light in the life of a human race.

AI generate some positive effect in the human life. Awareness about any diseases would be enhanced by AI. It solves the problems of economics very easily. The education sector ^{also} effects by AI. The NLP is an important tool in the education sector. On the other hand, AI has some bad effect in the life of a human race. The negative use of Chat gpt generate so many problems. Cognitive abilities are adversely

effect by the use of AI. On the other hand, AI lack the ability of students learning of students.

Awareness is very important in the 21st century. People do not have awareness about any social ^{xxx} global issue. A true knowledge about global issues is very important to take action. An awareness about any thing would be easy by the use of AI. So it can serves as the saviour of human. According to a book of **21 Lesson For the 21st century** by Yuval Noah Harari, if a WHO announced a disease. One doctor was not sufficient for the awareness about disease. But, if AI generated awareness about disease. A billions of people got aware about disease in few second. In the end, an efficient use of AI created awareness.

Education play an important role in the human life. An education is the right of every citizen. ^{xxx} ^{During} COVID 19, physical education was not accessible to anyone. So, AI played an important role in the education. It change the modes of education in the 21st century. The learning abilities of a student was enhanced by AI. For example, **NLP** (Natural Language Program) uses artificial intelligence to

understand the common language of human. And, how these language understand by the computers by NLP. Through NLP, an education was accessible to all the students in the world. So, an AI imparts a positive impact in the education sector.

Other than education, AI solves the problems that is related to economy very easily. Economy defines the progress of any state. The economy problems were very difficult. It is not easy for human to generate solution. By applying an AI into the economy, boost the progress of any state. For example, the inequality among income brings a negative impact on the economy. It is harder to find the controller of disparity.

So, the **AI Economist** brings **reinforcement learning** to tax policy to evaluate the data. So it creates the business. AI has brought positive role in the economy.

An emerging technology of AI is just like the magic. The sparkling light of magic bring happiness in the society. It depend on the persons how he uses the light of that magic. Many problems of the society resolved by the use of AI.

"Any sufficiently advanced technology is just like a magic". (Sir Arthur Clarke)

Hence, AI solved problems very easily in the global arena.

AI is used the best tool in the disaster management. Disaster destroy the state GDP. The disaster such as flood and earthquake destroy the livelihood of nation. Pakistan faced hazardous flood of 2022. A huge amount of infrastructure of Pakistan was destroyed due to flood. But, an AI is used to combat with the disaster. Just like Japan, introduced an **automated** emergency disaster system which awares the people about disaster. These system generated by the automated drones by used AI. So, AI can also the **substitutes** of human in the disaster management process.

The negativity is also spread through AI. AI adversely effect the human life. People do not do hard work. They use AI to generate any solution about any thing. People do smart work by using AI. It decreases the human capabilities to generate solution about any thing.

For example, a **Chat gpt** brings so many easiness in the negative manner. If a person want to make assignment on any topic. An AI generator chat gpt should a ready made assignment on that topic. So, it decreases the human abilities. Hence, an AI slows down the human abilities.

However, it also badly effect the education sector of a human. Learning through a virtual classroom lack the physical learning lessons. The online learning mode brings so many disparities in the evaluation process of assignment and grading. According to a **EDP Journal (2021)**, a research was conducted in the Russia. The teenagers students faced many problems as compare to high school students in the ^{online} learning process. There was about 17% student thought that the biased assessment of assignment was took placed in virtual learning process.

Cognitive abilities was decreasing due to the rapid use of AI. The internet addiction was reduced the cognitive abilities of a student. The low use of mental abilities was adversaly effect the health. It created the disorder in the human life.

According to **PMc (Public Medical Centre)** Journal, the prevalence of global internet addiction was about 6% globally. But, in the Middle East, the internet addiction was about 11%. Due to the addiction, the student faced ADHD symptoms such as psychiatric disorder. Hence, it adversely affects the human health.

Critical thinking is very important for the solutions that is relating to anything. AI would not replace the critical thinking of a human. The human capabilities to deal with the problems would not replace with the AI. According to a book, **21 lesson for the 21st century** by Yuval Noah Harari, he told about that the AI will not replace the human abilities. But, how AI increased the human efficiency. However, the abilities of a human does not replace with the AI.

AI creates the barriers in the communication skills. Before the emerging technology of AI, people enjoys the company of each other. People openly talks about their problems. Now, people uses mobile the whole day. It creates so many problems in the communication. According to a **theory of communication** by Jurgen Habermas, a discourse generate ethics through different actors generate

a solution to a problem. People's participation was very important for the problems solutions. A consensus was generated through mutual understanding. Hence, AI can limit the public participation.

Pakistan faces many crises. It is not easy for that to invest so many money in the emerging technology programs. The political instability and the economic crises was the major challenge. Pakistan faced ^{also} financial crises. According to a report of **IMF** (Pakistan Technical Assistance Report) 2023, Pakistan needs an amount of 10.7 trillion dollars to invest in the public sector development programmes. This value is more than the price of budget allocation of **727 billion** rupees in 2023. Hence, Pakistan is not ready to invest in the emerging technology programmes.

An efficient use of AI creates awareness in the human life despite of negativity. A use of technology depend on what type of person is used. A good use of AI brings goodness and awareness in the human life. A bad use of AI imparts a negative impact in the human life. According to

a Pew research centre, a research was conducted in the US. A result showed that 68% of the citizen of US effectively use AI. The citizen told that the AI aware about their physical exercise and sleeping by the use of tracker. The workers was easily aware about their health through AI. Hence, the awareness about any aspects of life becomes easy by the use of AI.

AI brings easiness in the education sector. The learning abilities of a person do not depend on the mode such as physical and online. A student has the capability to learn things through any mode. Within the emerging technology of AI brings so many positivity in the education sector. For example, the AI made the automation of administrative structure which creates the easiness in the administrative structure of education. (Artificial Intelligence in Education: A Review (2020)). It creates the easiness in the learning method through WWW (World Wide Web) and online learning. Hence, AI created positive role in the education sector.

Economics problems are just like a tough nut to crack. But with the help of AI, the nut would easily crack with the help of AI. It does not adversely affect the cognitive abilities of a human. An efficient use of AI serves to enhance the abilities of a human. According to a **Global analyst**, if AI is effectively used to solve the problems of economy, a 7% increase in the global GDP will be possible by the use of AI in terms of economy. Hence, it imparts a key role in the economy of a state.

AI spee

The rapidly use of AI is spreading like a light of magic without decrease the communication skills. AI cannot replace the communication skills. A magic stick in the hand of a magician brings a sparkling light of a magic. So, same with the process of using AI.

"Technology will never replace the great teachers but the technology is in the hands of a great teacher is transformational.

(George Couros)

So, AI will not replace the communication skills. An effective use of AI brings a magic in the society. Through this magic, many problems will solve. Hence, AI can be the saviour of human race.

Punitive actions takes times but it is not impossible. An introduction of remote sensing system into the Pakistan is not impossible despite of many problems. Hope for the best is the centre core of problems. Hope serves as a tool to counter with the problems. For example, China was not emerging technology a few years ago. But within time, China becomes a global emerging power. To counter US, China takes action despite of many problems. Hence, nothing is impossible without actions.

In the nutshell, AI can be saviour of human race by an efficient usage and management. Within the emerging technology, any sector would not be take away from the light of AI. AI will not replace any things. But, AI can impacts their effects in every sector of the human race.
