

Climate Change Awareness: More Important Than Climate Action

1. Introduction:

Thesis Statement: Climate change is a real threat to human survival and awareness is more important to implement climate actions to counter it.

2. Climate Change: A threat to human survival:

3. Importance of Awareness of Climate Change

a. Information about root cause can help to address this ~~perma~~ menace.

b. Knowing unprecedented pace of climate change can help in speedy actions

c. Information of impacts on ~~hum~~ can enhance actions

d. Action based on informed data are easy to implement

4. Way forward and recommendations

a. Public awareness about causes, impacts and solutions

b. Public participation in climate action

c. Informed citizens to address climate change from grass root level.

5. Conclusion

Changes are happening in this universe since the start of history but ~~some~~ not all changes are good or for good. Climate change is an example of such a change which have bad impacts on world, universe and humans. It is happening due to human activities and industrialization has increased its pace. It is a real threat to human survival and life on earth. It can be controlled through collective efforts from all levels. Climate awareness is the basic to control climate change and mitigate its impacts. The awareness about root cause can help to improved decision making for elimination of this menace. The knowledge about unprecedented pace of climate change can ~~not~~ help to speed up climate action. Similarly, the information of impacts can enhance climate action collaborations. Actions based on ~~not~~ authentic data and are easy to implement. The information available to citizenry can add in decision making process. Public awareness is the key to implement decisions. Informed citizenry is the key to implement climate action. So, it can be deduced that climate awareness is more important than climate action.

According to UN Chief Antonio Guterres "The era of global warming is ended, now it is the era of global boiling." The climate change

is the cause of global boiling. The human life as well as other lives on earth are in state of danger due to climate change. Climate related disasters are taking millions of ~~five~~ lives yearly. Climate related disasters are causing billions of US \$ lose to economy. The rising sea levels can ~~cause~~ be dangerous of it for coastal areas. Droughts and floods are other crisis induced by climate change. Climate Change is causing severe food shortages. At the same time ^{global} average temperature ~~increase which~~ is increasing rapidly, which is causing glacial outbursts, ice melting and changing weather patterns. All of the above mentioned issues are impacting human life one way or the other.

It is too important to have informed population to effectively control this issue of climate change. To address any issue effectively it is important to have awareness about the root cause. The awared citizens having detailed information about the root cause of the issue can effectively contribute to address the issue of climate change. According to NASA human activities have increased 45% increase in CO_2 (Carbon dioxide) level since ~~pre-indu~~ pre-industrialization. This is due to the un-awareness at mass level. If

the citizens have proper awareness, of this must be reduced to a significant level. The ~~awareness~~ Awareness about the root cause can help in addressing the issue.
