Q: 1 A

1 A: i Definition of Vaccines

Vaccines are the dead or inactivated microorganisms that are used to provide immunity and prevent any specific disease.

Example:

Vaccines made for Hepatitis B and C viruses

1 A: ii DEFINITION OF ANTIBIOTICS

Antibiotics are the chemical substances that is made to treat bacterial, viral and fungal infections

Example

Penicillin, cephalosporins

1 A: iii DIFFERENCE BETWEEN VACCINES AND ANTIBIOTICS

VACCINES

a- Vaccines are dead or inactive microorganisms that are used to prevent any disease or boosting immunity

br Vaccines can be given orally or by injections

c- Vaccines may have allergic reactions potential when given to people

d- Vaccine's effect is prolonged and it is mainly used once and the disease may not occur again

e- Vaccine can only prevent the onset of viral disease

ANTIBIOTICS

a- Antibiotics are the chemical substances used to treat any specific viral, fungal & bacterial diseases

b- Antibiotics can be given in any form such as tablets, drops, injections

c- Antibiotics can do allergic reactions as well as side effects such as nausea, vomiting and diarrhea

d- The action of antibiotics is only remained during a particular time of disease and it may not prevent person from that particular disease. The disease may occur again

e- Antibiotics treat ~~viral~~ viral, bacterial and

it cannot prevent bacterial
diseases

fungal diseases

f- Vaccine provides and increases
immunity

f- Antibiotics do not provide
immunity. It only treats
specific diseases.

g- Examples:

Vaccines for Hep B, C,
polio viruses and covid-19
viruses

Example

- Penicillin
- Cephalosporin
- Tetracycline

(Q: 2 A)

What is meant by :

GOOD AND BAD FATS

Good fats are those fats which help the body
to remove ^{cholesterol} fats through liver. They are called high

Density lipoproteins

Bad fats takes cholesterol to the arteries and
collect the cholesterol in the arteries. They are called
low density lipoproteins

Good Fats**Bad Fats**

- | | |
|---|--|
| a- Helps to remove extra fat from the body, cells, arteries. | b- It induces extra fat to the arteries, cells and the body |
| b- Good fat helps to remove cholesterol from the arteries | b- Bad fat delivers excess cholesterol to the arteries |
| c- It removes cholesterol present in the plaques, fatty deposit formed by the excess Low Density Lipoprotein intake | c- Its intake causes the accumulation of cholesterol in the arteries called plaque |
| d- Good fat do not cause diseases | d- Bad fats cause heart disease, blood pressure and liver disease |
| e- Good fat is of mainly two types monounsaturated and polyunsaturated fat | e- Bad fats are supersaturated, |
| f- It is found in olive oil, peanut oil, fish | f- It is present in beefs and butter mainly |

occur in
near Japan

east and west us
, the rest of the

cycle

→ Good fats are also called
High density lipoproteins

- Bad fats are also called
Low-density lipoproteins

Q: 2

B

(i) Vitamin B complex:

Uses:

- a) It helps in the formation of blood
- b) It helps in the ^{protection} formation of mucous membrane
- c) Vitamin B complex makes heart stable
- d) Vitamin B complex helps in the smoothing of skin
- e) It is help in reducing anxiety or depression

(ii) Vitamin E uses:

- a- Vitamin E helps in making blood cells
- b- Vitamin E helps in the brightening of skin
- c- It helps in boosting immunity
- d- Vitamin E helps in scar healing
- e- It helps in preventing heart disease

(iii) Vitamin D uses:

- a- Vitamin D helps in making bone strong
- b, Vitamin C helps in bringing energy
- c, It helps in regulating the absorption of Vitamin C that is good for teeth and bones
- d, Facilitates immune system to work
- e, helps in making teeth strong

(iv) Iron:

- a. Iron helps in blood formation
- b. Iron helps in growth and development of body
- c. Iron provides oxygen to muscles
- d. Iron helps in making hormones
- e. Iron improves sleep quality

Q: 2

D FOOD PRESERVATIVE

METHODS

Food preservative methods help to prevent food from spoilage and making it efficient and healthy to stay for a long time

Methods for Food Preservation

(i) Freezing

Food can be preserved through freezing. Freezing helps to inhibit bacteria to enter the food and prevent bacteria from multiplying and spoil the food.

(ii) Canning

Canning is also the method of food preservation.

It does not provide moisture and oxygen that does not allow the bacteria to grow and multiply when the bottle or the can is sealed.

(iii) Digging underground

Food can be preserved underground where there is no moisture or the oxygen that help bacteria to grow and multiply.

Potatoes are mainly undergrounded and preserved by this method.

(iv) Salting the food

Food can be preserved by putting some salt in the food. It will not allow the bacteria to grow and multiply.

v- Vacuum Packing

Vacuum packing is also used to preserve food.

The air is removed from the material where food is inserted creating a vacuum. It would not allow the microbes to live and multiply as there is no oxygen or carbon dioxide.

Dry fruits are mainly preserved by this method.

Q: 2 C

FOOD ADULTERATION

Type 1 Definition

Food adulteration is the practice of contamination of food materials by adding few substances that are collectively called adulteration. It is used for economical and technical benefits.

II Types of Food Adulteration

A- Intentional Adulteration

When the substances that look similar are added to the food, it increases the weight and gain more profit.

Example:

Mixing of pebbles, stones, marbles, water.

B- Incidental Adulteration

It occurs due to the negligence while handling food.

Example

- a- residue of pesticide in grains
- b- larvae growth

C- Metallic Adulteration:

Addition of metallic materials into food. It may occur intentionally even or accidentally.

Example

Lead or mercury in the food

D- Packaging Hazards:

Packaging materials in which the food is packed may interfere and mix with the constituents of the food that lead to packaging hazards

Impacts of Food Adulteration

a- Food adulteration increases toxicity in the body

b- Food adulteration decreases the nutritional value of the food

c- Food adulteration may affect the organs and lead to heart, kidney, liver disorders

d- Food adulteration such as milk adulteration
may harm the children

IV- HOW TO PREVENT FOOD ADULTERATION

III a Food adulteration in industries may be prevented through strict laws and government interventions

III b- Wash the fruits and vegetables before cooking

III c Awareness must be given to the citizen through media.

III d Government must invest in tech-savvy technologies that support food safety, elevating food manufacturing infrastructure

Q: 1 C

GALAXY

Galaxy is the fundamental unit of the Universe. It consists of hundreds and thousands of stars with gas and dust.

Classification OF Galaxies : According to Shape:

a - Elliptical Galaxies

Elliptical galaxies are the most abundant type of galaxies. Due to their age and dim qualities, they are outshone by younger, brighter collection of stars.

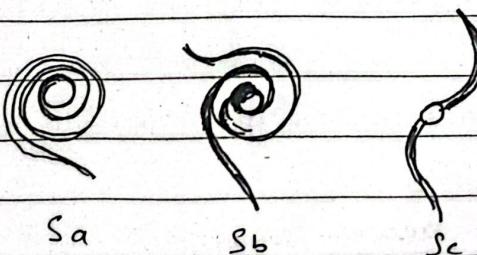

Example

E0 to E7

b - Spiral Galaxies

The stars, gas and dust are gathered in spiral arms that spread outwards from the galaxy center.

They are classified on how tightly they wound their spiral arms are S_a, S_b, S_c.

"Milky way", where we live is also a spiral galaxy

C - Irregular Galaxy

The galaxies that have no particular shape.

They are the smallest galaxies and full of dust and gas. Their star formation are due to the presence of gas and dust.

Black Hole:

Many galaxies are thought to have certain black holes in the centre. Black hole has very high density and gravitational pull that it is difficult for any thing even light to escape from it.

Q1-

B

TSUNAMI

Definition

A series of waves that are produced due to the sudden disturbance under the water's surface is called 'Tsunami'. These are also called seismic waves.

Causes of Tsunami:

- (a) Earthquakes
- (b) Volcanic eruption
- (c) Asteroids crashing the ocean
- (d) Under sea landslide

Formation of Tsunami:

- ① Tsunami occurs when an earthquake vertically shift the seabed by several meters, displacing hundreds of kilometers of seawall.
- 2- Large waves began rippling across the ocean away from earthquake's epicenter
- 3- In deep water tsunami moves at speed of up to 800 km/h.

Characteristics of Tsunami

Distance from one wavelength to another is between 100 and 300 km. wave height small in the open sea.
They can travel upto 1000 km/h. They are not dangerous in open deep water.

However, in coastal areas, water level is shallow, the wave will slow down but the height increase up to 30 meter high.

CYCLONE AND TYPHOONS

Both cyclones and typhoons are the Tropical cyclones. They originates over the oceans in tropical and coastal regions.

Typhoons :

type of tropical cyclone that occur in
western North Pacific especially in near Japan

Cyclones :

The region except Japan, East and West USA,
and the western North Pacific, the rest of the
areas may have cyclones.

Formation of Tropical cyclone :

In every cyclone there is

a, low pressure area

b, High pressure area

Outer area of cyclone consists of cool air coming
from high pressure area which surrounds the central
pressure area. It is called the eye of the storm
