

1
Topic: 6 Climate change awareness:
more important than climate
actions

Outline

1- Introduction

Thesis Statement:

Climate change is a reality
The temperature of planet is increasing
The melting glaciers, wild fire are
the indicators of climate change.
However, practical steps needs
devised to counter the issue. The
awareness of people as well
as the actions both are required
to counter the issue.

2- How climate change awareness more important than climate actions:

3- The Importance of climate change awareness: is more than climate actions:

- awareness educate people from
threats of climate change
- When the people educated
they will take actions
- the climate ^{change} is occurring due
unawareness of people.

- d) The awareness about renewable source of energy
- e) The awareness about Forestation
- f) The awareness about the risk of climate change due to deforestation

4- climate actions are also important:

- a) The climate actions are necessary
- b) Only theory (awareness) is not enough
- c) The action of planting trees
- d) The action of govt to take steps for renewable source of energy
- e) The action to stop the deforestation

5- Both the climate change awareness as well as the climate actions are same important:

- a) First govt, department take action, campaign of climate change than people will aware.

- b) The renewable than
- c) The benefits take

- d) The deforestation
- e) The Hydro for

6-

b) The awareness about the renewable source of energy and their action required

c) The awareness about the benefits of forestation and their take action

d) The awareness about the deforestation threats and their action to stop

e) The awareness of losses of Hydro carbon use and their action for alternative measure

6-conclusion

Essay

The increase in the average temperature of the planet, the fast melting of glaciers, the wild fire are the indicators which show that climate change is a real problem. But the awareness of the people about climate is important, because when the people aware from the risk of climate change, from the losses of deforestation, from the benefits of the renewable source of energy, from benefits of forestation, and from the losses of the more use of hydrocarbons. They will be taking actions like, planting trees, action convert energy system to renewable source of energy, they will not cut the trees, also they will not waste the cultivating lands. So we can say that the climate change is

a real problem. However, both features i.e. the awareness as well as the actions of climate change are same important.

We can define the awareness of climate change as well as the actions of climate change. The awareness of climate change are those campaigns, through which the people are aware from threats of climate change. Like the campaign about threat and losses of the smoke of the vehicle, industry etc. And other awareness like benefits of the plantation, the benefits of the renewable source of energy. These awareness are more important than the actions, because when the people are aware and educated about the risk of climate change, then they will take actions against the these dangerous risk of climate

The awareness of climate change is important than the actions of climate change, because when the aware through campaign and campaign of the climate change through media, the will aware from the side of climate change and they will take actions against this risk. For example the PM Imran Khan campaign of billions of trees awared the people from the benefits of the forestation.

When the people are awared they will be take action in favour of climate change, because it's a collective problem of all human and living organism. And all the living organism will be effect from the climate change. So through awareness people automatically move toward actions. For example all the educated

People that of climate and work, will give

The change cause like of of of who not cl w

People that know the risk of climate change plant trees and take interest in this work, because they know it will give benefits to us.

The rapid fast climate change is basically the cause of human being actions like the industry, the use of hydro carbon, the cutting of trees. So they are unaware of the losses of their actions. When they are aware, they will not be doing these anti climate actions. So the risk will be reduced.

The people are unaware of the benefits of renewable source of energy. When they are aware through proper campaigns they will be skip the hydro carbon, and they will be giving priority renewable source of energy, so the awareness

Will move them toward renewable source of energy.

The awareness about the renewable source energy also play an important role in reducing CO_2 and other poisonous gas from our. For example when people know about solar energy, its easy and cheaper source of energy. Its also environment friendly source of energy. So the people adopted this method of energy. Wind energy is also one renewable energy. Hydel energy, wind energy solar energy are the examples of renewable sources of energy, which are environment friendly source of energy. So when the people are aware of their type of energy and their benefits they will adopt these source of energy.

4
The awareness about forests and its benefits also very important for green and clean environment. Because the forests (plants and trees) absorb hydrocarbon, CO_2 , and release oxygen O_2 . So through process the environment is remain clean green. When the people aware from the benefits of forests than they will not be cutting the trees, as a result the environment will green and clean. So this awareness is also necessary.

Deforestation is a process in which the people cutting the trees and did not planting new trees. So the forest and greenery from planet is reducing. As a result the level of CO_2 gas also be increase with this

process, because the plants absorb the CO_2 and release O_2 . So the awareness about the deforestation and its losses is also very important. So when the people is aware of these losses of deforestation they will avoid deforestation. If the cut trees they will be planting new trees, because they will be knowing the losses of deforestation.

Climate actions are also important, because when someone violate the climate change rules like the cutting trees and did not new trees. The actions against them is necessary.

The action of planting trees very important; when the are informed, but there are other factors like the land for forest, the resource

the funds soquised. So when the govt does take actions and does support the people in this work the people also not take interest in this work. So when the govt or any institution take initiative and start planting trees and insure its benefits the people will be taking care of these trees.

The actions for renewable source of energy is also can clear through the action of governments. When the government take action of making dams, the solar plants, the wind energy plants. The people will be received awareness as well as benefits of both the energy and the environment friendly energy which is also environment friendly.

12
Pakistan main hydal energy
source are Turbela dam,
Mangla dam, Warsak dam
etc. WAPDA Depends on
these dams. Pakistan also
making some other dam
like Dasu dam, Mohmand
dam, Diamas Basha dam
which will be help in
energy products. And also
an environment friendly
energy. Solar energy projects
under CPEC are Bahalpur
Solar Park etc, Also the
wind energy in Karachi
and Gwadar are the
part of CPEC projects. So
these energy projects are
very beneficial, cheaper
energy source as well as
environment friendly energy
source. So the actions and
initiative of the government in
this regard very important.

The Actions against the deforestation

are also very important, because when the people are cutting the old trees, and they are not planting new trees. The environment will be polluting. The level of CO_2 gas will increase and O_2 gas will be decreasing as a result the depletion of ozone layer also be increasing. As a result the average Temp of the planet will be increasing. So the action of to stop deforestation is also very important.

Both the climate change awareness as well as the climate actions are same important, because the awareness are first, but the actions of planting trees and stop deforestation are also important.

First of all the campaigns of awareness about the risk

of climate change, than the actions are necessary. For example when government or any organization run the campaign of the risks of the climate change. And the people still not aware of these campaign, or ignore it. Then the actions are necessary. So both are important.

The government or any other organization like UN etc run campaign of awareness about the renewable source of energy, but the people want practically benefits. So when these institut run campaign and also take the practical actions, for the renewable source of energy, the people will aware and also the benefits will be received.

The awareness about the

forestation and their actions
 and initiative to planting trees
 also important. Because when
 the people aware through
 campaign, but they do not
 take actions and initiative, because
 very one is busy in their
 own business and works. So
 when the government, or
 any other organization
 run the awareness campaign.
 As well as they take the
 initiative, through this process
 both the benefits the awareness
 of the people, as well as the
 actions also done.

The awareness and action of
 forestation is also necessary.
 when the aware through
 campaign and then take
 initiative with also aware
 ness campaign. they people
 will aware and work will
 be done. For example the
 initiative of PM Manmohan Singh

16
billions of trees was a
good initiative, and action which
was appreciated by world leaders
at international forums.

The awareness about the
losses of coal and hydro
carbon energy resources. And the actions
against these, like the converting
of the system to other than
hydrocarbon, like the electric
vehicles, the renewable source
of energy, solar, wind and
hydal energy. First the the
campaign of awareness than
actions and initiatives to lead
the people are needs, than
issue will be handle with
a good manner. So the
awareness as well as
the action are same
important in the climate
change risk.

In summation we can
say that the climate

Change is a real issue. But practical steps needs to handle the issue, in which both the climate change awareness as well as the climate action are same important. First of all the people will aware from risks of climate change through campaign on media social media, and posters in bazaars, city. And then practical actions and initiatives sequenced to implement on campaign as well as lead the people in actions against climate change. So we can say that both the climate change awareness as well as the actions and initiative of climate both are same important. And these actions will take to handle the issue of climate change.
