Topic: Space Race is the World's Biggest Money Waster

Outline

1) Introduction

- a) The evolution of space race in the world
- b) Decoding and defining the statement
- c) Thesis statement

2) How Space Race is the World's Biggest Money Waster?

- i) The fantasy of space race pushes country in ignorance of their basic issues;
 - a) Case in Point: India's space and moon ~~mission~~ mission
 - b) Countries go in space competition without focusing on their core issues
- ii) Wasting a lot of money on space race rather than human development
- iii) Conquering the space is not worth giving
- iv) The creation of space machines cause emission of greenhouse gases

v) Space race is a continuing and unbenefitting race without its final stop

vi) Developed and developing countries should invest money in core issues of the world;

a) cases in point: global warming and conundrum of climate change

vii) Space race is against the laws of nature it is a race without any productivity

viii) Countries those send missions into space put lives of their space engineers into danger;

a) case in point: Illness of Armstrong

ix) In the race of space, countries often miss their fundamental issues

x) The conquering space creates chaos among the people of states

3) Space Race is not the World's Biggest Money Waster

i) Winning the race of space is the the evidence of supremacy of states

a) cases in point: The fascination of going

into space from Soviet Russia to the US

ii) Exploring the space means discovering the new wonders of the universe

Essay

After the catastrophic end of the world war II, the major powers of the world mainly the US, the UK and the USSR were then trying to show their hegemony and experimenting every tactics to prove their supremacy in the globe. The end of barbaric world war II had brought the race of super powers between the US and the USSR in the shape of the cold war in 1950s. To cut the story short, this war opened the concept of winning the race of space. The USSR was the first country who sent its space mission in 1960 under the supervision of Sputnik-1 team. After the Soviet, the US tried its best to prove its supremacy in space winning. From this time the race of winning space began that developed a thirst of conquering

Space among the countries. Countries now without any kind of rationality try hard and invest a lot of their useful sources in useless race of space. It is clear and lucid that space race is the world's biggest money waster. In the barbsness of winning space race, countries who want to win space race they ignore their basic and core issues and start investing in space race, countries also try to seek space winning rather than focusing on their core problems which are arising before them. In addition to this, countries waste a lot of money in space winning rather than using it on human developments; they do not understand that wasting a lot of money in space race is not worth at all. Along with this, the creation of space machines is also a responsible in the emission of greenhouse gases that are causing global warming. Moreover, countries should know that space race is consistent and unending race that has not any

ultimate destiny as space is the full of a myriad mysteries. On the contrary to this perception, many skeptics opine that conquering the race of space is a proof of a state's supremacy and a way to prove a state as a super power; however, they fail to give solid arguments to justify this biased perception about space race. Hence, it is clearly say that space race is the world's biggest money waster.

To begin with, the fantasy of space race pushes country in ignorance of its basic fundamental issues. In the quest of winning the battle of space, a country gets diverted from solving basic problems which are must to be solved. In this point of view the examples of India are highlighted; as India invested a lot of money on its first mission Chandrayan-1 that was all set to land on the Moon despite, the a lot of efforts and money wasted on it. Chandrayan-1 collapsed before reaching on its destination. Despite the failure of India's first moon mission, the lust of winning

Space did not stop here it again sent its moon mission Chandrayaan-2 that landed on the moon after waste of a lot of money. India wasted a large resources of it, it is a country that is faced with a plethora of crises such as poverty, climate change, global warming, unhygienic conditions and many other problems. Instead of having a lot of core issues countries try to send their missions in space that is a mega threat to the future of their people. Ergo, the space race puts countries in the state of ignoring their basic problems.

Moreover, countries waste a lot of money in conquering the space race rather than investing in human development of welfare. As the human development is the guard of future, without the betterment of human beings no country in the world can achieve the paths of prosperity. The fascination of space race lets states into a dilemma to have a receipt of winning space in the result of this, these

Countries waste their larger money in conquering space rather than investing that money on education, healthcare, infrastructure, economic, social and political well-being.

In short, countries waste a lot of their useful resources in winning useless space race rather than spending on their people's betterment.

In addition to this, the creating of space machines is also liable for the emission of greenhouse gases which cause global warming and impact climate of the earth. According to the IPCC, "The space machines pollute the atmosphere and disturb the eco system at large number." This revelation IPCC signifies that the space race machines are also responsible for the emission of greenhouse gases along with various issues. So, it is obvious that greenhouse gas emission is also product of space machines.

Furthermore, Space race is the continuing and unbenefitting race as it has no final end or stop. The Universe has been evolving and expanding for

many years it has not final stop or time of evolution. In a single day, many Stars, comets, asteroids and other cosmological bodies get evolved in number of millions and billions. Some years ago, Pluto was a planet now it is dwarf planet so, cosmological bodies have no singularity or finality of their ultimate position or classification. Space is full of mysteries no one knows about its beginning and ending it can be just predicted only. Hence, the space is limitless and conquering it entirely is out of the human imagination.

Moving ahead, developed and developing countries should invest their money in core issues rather than showcasing their conquest on space race. The world is faced with lethargic threats of global warming and climate change which is a serious threat to the people of this globe. Events of recent Urban floods in UAE, Brazil and high temperatures in Pakistan and

India, these all incidents are the alarming threats for the world; it cause a havoc destruction if measures are not to be taken. So, in the space race winning developed and developing countries do not tackle core issues.

Moreover, space race is against the laws of the nature; because nature is beyond the understanding of human beings. None can courage to know the systematic principles of the nature. Nature has settled process of dealing its functions and interfering into its on going laws can put a blockade on its functioning. Let nature be allowed to observe its running system intervention into its working is unbearable and human beings have to pay in shape of loss if they do not stop winning the space. Therefore, winning space is contrary to rules of the nature.

Along with this, countries who send their machines into space put the lives of their space engineers and aeronautics into danger. When aero or

Space engineers land onto space bodies they get infected of various harmful diseases. The example of Neil Armstrong first man who landed on the moon is clear evident of this, when Armstrong returned after moon landing he had got infected of various diseases and died of those diseases. Hence, Space race also cause diseases among space goers.

Moreover, the craze of space race puts countries in states of doing nothing for solving of their core and fundamental beliefs and issues. Countries often waste a lot of their revenues in space race rather solving issues of their problems. So, it is the race of space that stops countries to think of solving their peoples core issues.

Last but not the least, the space race among the countries create a conflict and chaos in their peoples which result into rise of protests and slogans against their governments which

lead towards divide of the society. Among the people one school of thought favours the winning of space race and call it their victory whereas, another school of thought opposes the conquering space, calls it useless step towards the religious belief and destruction of resources. Thus, the eagerness of winning space divides the people of a nation.

On the other side, there is a smaller group of skeptic scholars who believe that the winning of space race is not the world's biggest money ~~in~~ master. They give argument that space race winning is the token of proving a country super power. In reality, it is not a fact. The winning space race is not a key to prove supremacy, before the space mission of the USSR there were two to three powers who were superpowers of that time such as, the UK, the US and the USSR. So, this perception of proving super power is useless and illogical. The sign to super power states is their investment on human development,

their economic well-being and the prosperity of their people. Hence, it is clear that winning of space race is not a mark to prove who is super power and who is not it is just lame argument.

Moreover, another argument that is given by skeptics, is they say that going into space gives a chance to discover the new wonders which are hidden into space. They say while doing this countries come to know about universe. However, these skeptics do not know the reality that the space is the limitless and beyond the human beings imagination. Space consists of billions of stars, galaxies, comets and asteroids, for the man discovering the wonders of the space is impossible and waste of money. They forget that rather than wasting money in space exploration they should use on human development. Ergo, space exploration is not the discovery of the wonders but it is the waste of money and time.

To conclude this essay, it is evident that space race is the world's biggest money waster, because developed and developing countries waste their money in quest of winning space race rather than investing on core issues such as global warming and climate change, space race is also opposite to the principles of nature. Moreover, countries who send their engineers and space staff into space they put their lives at risk of lethal diseases. Lastly, the conquering of space race segments the unity and belief of people. On the other side, their perception among the some pessimists that, winning the space race is a sign of proving a country super-powers. They furthermore argue that exploration of space gives a chance to discover new wonders in the space. However they ignore the reality that being super power requires progress, prosperity and development of state's people not winning the race of space. They fail to give authentic and valid argument to prove their argument. One should

comprehend that welfare and development of the people is a key to prove Super power to a state not winning the race of space. Hence, winning the space race is useless fantasy countries should invest on human development and solving basic issues rather going into space.
