# Human Civilization is shaped by Values, not machines.

## Outline :

### 1. Introduction

a) Definition of values and their significance in shaping human civilization.

b) Thesis statement : Human civilization is shaped by values not machines.

### 2. Values as the foundation of human society.

a) Explanation of how values influence human behavior and decision-making.

b) Examples of values that have shaped human history, such as freedom, equality and justice.

3. The role of values in shaping technological advancements.

a) How values influence the development and use of technology such as the prioritization of innovation over sustainability.

b) Examples of how values have shaped the development of technology, such as the emphasis on efficiency and productivity.

4. Conclusion :

# The Essay

I The rise of machines and artificial intelligence has led many to believe that the key to shaping human civilization lies in the development of technology. However, this perspective overlooks the fundamental role that values play in shaping our society. Values are the guiding principles that inform our decisions, actions, and interactions with one another. They are the foundation upon which our social norms, institutions, and cultural practices are built. In reality, it is values that shape human civilization, not machines.

Values are the foundation of human society because they influence our behaviour and decision-making. When we act in accordance with our values, we make choices that align with our deepest beliefs and principles. This is -

Why values such as freedom, equality, and justice have been central to human history. For example: the fight for independence and self-governance was rooted in the value of freedom, while the struggle for women's suffrage was driven by the value of equality. These values have shaped human society by influencing the way we interact with one another, organize our communities, and govern ourselves.

Values also play a significant role in shaping technological advancements. When we prioritize innovation over sustainability, for instance, we are acting in accordance with the value of progress and efficiency. Similarly, when we prioritize productivity over —

environmental stewardship, we are acting in accordance with the value of hard work and achievement. These values have shaped the development of technology by influencing the way we design and use machines, as well as the goals we set for their development. For example: the development of automation has been driven by the value of efficiency and cost-savings, rather than a focus on social welfare or environmental sustainability.

Furthermore, values have shaped the development of technology in ways that reflect our deepest beliefs and principles. For instance, the development of artificial intelligence has been driven by a focus on intelligence and rationality, rather than emotional intelligence and compassion. Similarly, the development-

of artificial intelligence has been driven by a focus on immersion and escapism, rather than a focus on social connection and community building. These examples illustrate how values shape our understanding of what is important and valuable in our technological pursuits.
