

Climate Change In Pakistan; Causes and Consequences

Outlines

1: INTRODUCTION :

1.1: Hook .

1.2: General Statements .

1.3: Thesis Statement ;

Climate change is a deadly threat for not only humans but all the living bodies. Main causes are, "Air Contamination", "Water Contamination", and "Land Contamination" due to unmonitored human activities.

The consequences are devastating and lethal including; "Ocean death", "Species loss", "Extreme weather" and "Humans Health deterioration" .

2: MAIN BODY:

2.2: CAUSES;

2.2.1 : AIR Contamination

(a) Green House Gases

- (b) Fossil fuels
- (c) Fertilizers Sprays

2.2.2: LAND Contamination;

- (a) Excessive Farming.
- (b) Industrial waste.
- (c) Poor waste management.

2.2.3: WATER Contamination;

- (a) Industrial Effluents.
- (b) Human waste.
- (c) Excessive fishing.

2.3: CONSEQUENCES:

2.3.1: OCEAN Death;

- (a) Marine life.
- (b) Ocean level-rise.
- (c) Bleaching.

2.3.2: SPECIE Death;

- (a) Extinct Animals.
- (b) habitat Loss.
- (c) Wild Fires.

2.3.3: Extreme Weather;

- (a) Global rise in Temperature.
- (b) Unpredictable weather patterns.
- (c) Droughts and Famines.

2.3.4: Human Health

Deterioration;

- (a) Declined Life expectancy.
- (b) Cancers proliferation.
- (c) Infants mortality.

3: CONCLUSION -

3.1: Suggestions.

"The eyes of all future generations are upon you. And if you choose to fail us, I say - we will never forgive you".

These were the words by a young Swedish environmental activist Greta Thunberg, (In UN Climate Summit 2019).

According to IPCC report,

"The climate change is reversible until 2030".

Which means we are the last generation who have last chance to save the world from the anticipated havoc of climate change.

Each country is equally susceptible to the menace of climate change.

But, the less fit are eliminated and the fittest survive. The under developed and periphery countries are

more prone to the destructive outcomes of climate change.

Though contributing the least in factors of climate change, countries like Pakistan are

the top among the most affected countries. Pakistan

produce less than 1% of world's planet-warming gases but it's at 8th rank of

most vulnerable countries to climate change.

Nations that will not adapt, are more likely to face the consequences.

Climate change is a deadly threat for not only humans but all the living bodies. Main causes

are "Air Contamination", "Water Contamination", and "Land

Contamination", due to un-monitored human activities. The consequences are devastating

and lethal, including; "Oceans death", "Specie loss", "Extreme weather" and "Humans Health detesioration".
