- G) Conclusion

The Essay:

Over population is not a new problem it was first noticed in the 16th century by Thomas Malthus when he wrote a book "An Essay on the Principle of Population". Sadly, an issue which was observed centuries ago still exists in the world among so many nations. The idea of over population is different for all. However, generally it is defined as "Overpopulation occurs when a population's size exceeds the capacity of its environment to provide for it, resulting in environment degradation, resource depletion, and a decline in the quality of life". Aristotle's concept of population was quite the same as he did not encourage over-population but he also was not in the favour of lower-population-growth. According to

1 1
him large population ~~made~~ could make
governance difficult while small
population might not provide
enough manpower for defense
or sustaining a strong economy.
Over-Population can effect not only
a family but a whole large
country. That is the reason that
China introduced One child Policy
and implemented it in 1979 till
2016, and preventing estimatey
400 billion births. The country
focused on individual growth
as well as economic growth,
which helped them making the
country in the list of World's
Top most economically stable
countries.
