

## Introduction:-

Climate change is real it is happening right now, it is the most urgent threat facing our entire species and we need to work collectively together and stop procrastinating. "Climate Bundchen said, one thing leads to the other. Deforestation leads to climate change, which leads to ecosystem losses, which negatively impact and caused our livelihoods: it's a vicious cycle". Additionally, generating electricity and heat by burning fossil fuels causes chunks of global emission. Most electricity is still generated by burning coal, oil, or gas, which produce carbon dioxide and nitrous oxide powerful greenhouse gases that blanket the earth and trap the sun's heat. Globally, a bit more than a quarter of electricity comes from wind, solar and other renewable sources which, as opposed to fossil fuels, emit little to no greenhouse gas or pollutants into the air.

Furthermore, Manufacturing and industry produce emission, mostly from burning fossil fuels to produce energy for making things like cement, iron, steel, plastics, clothes and other goods.

# → climate change in Pakistan, Causes and consequences.

## 1/ Outlines-

1.1 = Hook

1.2 = General statement

1.3 = Thesis statement

## 2/ causes of climate change in Pakistan:-

2.1 = Generating Power

2.2 = manufacturing goods

2.3 = Cutting down forests

2.4 = using transportation

2.5 = Producing food

2.6 = Powering building

2.7 = greenhouse gas emissions

## 3/ Consequences of climate change in Pakistan:-

3.1 = Intense drought

3.2 = water scarcity

3.3 = Severe fires

3.4 = rising sea levels

3.5 = flooding

3.6 = Melting ice polar

3.7 = catastrophic storms

3.8 = Declining biodiversity.
