The Essay

"When the best minds leave, a nation loses not just its people, but its ~~future~~ future". Imagine a country where the brightest minds, Scientists, doctors, engineers, and artists leave in search of better opportunities, leaving behind empty laboratories, understaffed hospitals, and stagnant industries. This phenomenon, known as "brain drain", is a growing challenge faced by many nations around the world. Brain drain occurs when highly skilled individuals emigrate from their home countries to seek greater prospects abroad, driven by economic, political, social factors. While their departure may bring personal success, it often results in serious consequences for the countries they leave behind. The true wealth of a nation lies in the education of its people and when they depart, so does its hope for greatness. Understanding the causes and consequences of brain drain is essential if we are to find ways to preserve and nurture talent within national borders.
