Technology is a Threat to Privacy

1) Introduction

- a) Hook
- b) Background
- c) Thesis statement

2) What is technology

3) Technology as a threat

- a) Effect domestic privacy
- b) Surveillance cameras are hacked
- c) Online payment led way to card hacking.
- d) Business proposals are theft.
- e) Celebrities faces AI edited criticism
- f) Hacking of environmental satellite.
- g) Military & other institutions at risk (fishing)

4) Solutions to overcome

5) Conclusion:

The Essay

Technology is like an octopus which catches the head of the society in its feet so strongly that it becomes impossible for the nations or the society to make itself free. Technology is the use of innovative functions that is provided by computer based software. ~~provide~~ It makes life easier and more liveable but at the same time poses great threat to human existence. Technology ~~then~~ when used unchecked can threaten privacy, even the surveillance cameras are often hacked by hackers for the good amount of money from the owner. People prefer online shopping, billing etc which again threatens their digital currency. Mostly the business proposals are hacked which ~~pos~~ affect a company's overall performance. In the same way Celebrities are

criticized for the videos they even don't know about. As in this era of multipolarity countries go on increasing their power & uses their rivals military & other secure data to threaten them.

Govt need proper check & balance & a social awareness campaign to educate every common & proper about the threat the technology can pose.

Awareness campaign should be implemented in diff institutions as well as as most of technological ~~that~~ ^{socially} prey become the common people. Hackers uses private images, videos to threaten people & even voices of people are used to extract proper amount of money from a family through the voice of the members. In Pakistan this scam is so common that even with a little amount of money in easy paisa account you get 1000 of ~~ca~~ thousands of calls per month. The ~~hack~~ scammers are becoming wiser and wiser as they are now adepts using bank-typed number & extract information about accounts & within a second ~~you~~

people are left with zero penny in their pocket. One could say that cameras will help this problem out, as recently atm machines were hacked & people were scammed world wide but still this problem is hard to eliminate.

Surveillance cameras implanted for public safety & smooth social activities, but again they are not safe, as a black hackers can hack it. The most concerning point about surveillance cameras is that often terrorist groups use it for their dirty planning. As evidence from the India's Bombay & attack that their surveillance cameras were hacked & used for by terrorist to smoothly execute their attack in the city.

Govt need to increase security at local level by making white hackers group who can get a proper check on everything happening in their surrounding.

Technology has shifted all humans activities to E-systems, people don't go out for shopping, paying

bills & other day to day activities. All are done by their phone, which again makes them easy prey for the hackers. People need to understand that ~~the~~ doing their work online is great but they should use this opportunity wisely & should never rely on websites that are not authentic.

In business industry, rivals often use business proposals of other companies to degrade ~~them~~ & defame them by ~~the~~ ~~indirect~~ hacking their secure and private data. In the same way celebrities & other high class people are threatened the most due to their social interaction. AI edited videos that are often awkward poses criticism on them. Recently MAMDANI video make internet on fire after his mayoral selection. In the same way the IMRAN KHAN DEATH SCANDAL being immense disreputable in the nation which was a totally fake document an edited body in a letter of the Federal ministry of foreign affairs.

(6)

Environment is an issue of the 21st century that is at high call due to its greater & worse affect globally. Countries are trying hard to maintain a proper check of their environment by sending environmental satellite to space, which can detect the early signs of any threat. But rivals countries often hack the satellite system which not only impact the environmental check but also other things like the GPS. Thus making countries paralyzed to take any action against such threat.

In the same manner world shift towards power maximization & this is no more ^{a war} of the weapons but rather a war of the chip (the technology).

It is possible that in very near future there will be ~~no~~ wars ~~any~~ of technology. Even now countries often go on hacking their rival military & other data making their sole defence sector paralyzed.

Countries need to focus on institution that could premed awareness about the hackers

①

their intentions & their planning. Nation needs to hire more white hackers on from local to federal level to secure the private & fragile data of the country. Black hackers, & scammers & fishers should be penalised to great extent so that no one in the upcoming period ever try to repeat this phenomena. Technology is an assentant but humans bad & rough use make it a burden, a threat and source of insecurity. If used properly with check & balance then it will be an obedient slave. It can be concluded that technology being a safe hand in many sectors is also a threat due to its vulnerable porous domain. From images of an individual to nations top secret data all are in the ~~hand~~ of like a paper on water surface which can be at any time drowned & converted into blank & pieces form. Nations while ~~ing~~ doing other security measure should also

②
focus on this domain, as it is the most critical of all. Even in the last 14 & 15 of August India & Pakistan bombarded each other with the bullets of hacking each others top institutions. That was a game for the young hacker but for a nation that was more like a strike on its face.
