

General instructions to be followed to pass essay

1- Spend time on rightly comprehension of the topic, you won't pass the essay unless and until you addressed the asked part

2- Try to make your main heading in the outline from the words in the question statement

3- Try to add hook in the introduction. The length of introduction must be of 2 sides

4- your topic sentence in your argument must be aligned with the ending sentence

5- Avoid firstly, secondly, thirdly etc in outline 1st 2nd person pronouns

6- add references in your arguments with proper writing. Go for diversification of references

7- Do not add new idea or point in Conclusion

8- You won't pass the essay if make more than 4-5 grammatical mistakes

9- outlines that are not self explanatory or does not aligned to with the essay statement are liable to mark 0 and the essay would become null and void

10- always try to be relevant to the topic, if even your 1 or 2 arguments are irrelevant, the examiner would not pass your essay.

Essay

TECHNOLOGY IS A THREAT
TO PRIVACY

Mark
01

1. Introduction:

a. Hook

b. Background

c. Thesis Statement

Technology poses a serious threat to personal privacy, as social media platforms collect user

information, surveillance systems monitor our behaviour, smart

phones function as tracking devices, cybercriminals attempt to steal data, AI and

facial recognition enables unwanted identification, and frequent data

breaches compromise sensitive data stored online.

2. Understanding Privacy in Digital Age:

3. How Technology Threaten privacy:

DATE: _____

DAY: 8-12-25

- a- Social media Data collection
- b- Surveillance technology
- c- Smartphones as tracking Devices
- d- Cyber Crimes and Hacking
- e- AI and facial recognition
- f- Data Breaches

4. Conclusion

You haven't understood the topic well. Change most of your points. Besides, work on your paper presentation otherwise the examiner won't pass your essay. Improve your phrasing. Word selection must be improved. Must attend the tutorial session for further suggestions and mistakes.

Your points are not enough, increase your points.

DAY: _____

"TECHNOLOGY IS A THREAT TO PRIVACY"

As every click, search, and interaction leaves a digital footprint, can personal privacy truly exist in the age of Big Data and constant surveillance? The question of personal privacy in the digital age is a complex one with no easy answers. In today's world, technology has become part of almost everything we do. From using smartphones and social media to online shopping and digital banking, every activity is recorded and stored somewhere. Modern devices collect our location, contacts, photos, and even our habits without us noticing. Our personal life is no longer limited to our private space; it now exists on screens, apps, and online servers that we cannot fully control. This shift has raised serious concerns about our privacy. The balance between enjoying the benefits of technology and protecting our privacy has become one of the biggest challenges of the digital media. Technology poses a serious threat to personal privacy, as social media platforms collect user

You are providing me the general idea and information.

Besides, avoid 1st 2nd person pronouns in your writing

Information, Surveillance Systems monitor our behaviour, Smart phones functions as tracking devices, Cyber Criminal attempt to steal data, AI and facial Recognition enables unwanted identification, and frequent data breaches compromise sensitive data stored online.

In the past, privacy was largely limited to physical spaces - homes, personal letters and private conversations were considered safe from intrusion. People had control over who could access their personal information and life. These spaces were largely unmonitored. However in the digital world, privacy has taken on a new and more complex meaning. Every action online, leaves behind digital traces, making personal information widely accessible, often beyond our control.

Social media platforms are among the most significant threat to personal privacy in the digital age. Every action on these platforms - from posting photos and sharing status updates to liking pages and joining groups

generates personal data that is constantly collected and stored. Platforms track user interactions, location information, browsing history, and even preferences, often without users fully aware of the extent of monitoring. This ~~private~~ information is then analyzed to create detailed profiles which are used for targeted advertising, influencing behaviour and sometimes sold to third parties.

Many users unknowingly provide access to sensitive information through default privacy settings or by accepting terms of service without careful review. Furthermore, social media accounts can be vulnerable to hack, leading to exposure

You are incorporating too many ideas in your introduction

of personal details, photos and videos. In this way, social media transforms private information into a commodity, making personal life increasingly visible and accessible, and posing serious risks to individual privacy in the digital world. Beyond individual threats, social media can also affect national security. Enemy countries create fake accounts to spread false information and weaken a nation's image, causing confusion and mistrust among the public. This

type of digital manipulation is a serious national-level threat because it can influence public opinion, disturb social harmony, and even interfere in political processes.

Beyond social media, another major challenge to privacy in the digital age is the rapid growth of surveillance technologies. It has become a major concern for personal privacy in the digital age. Government and private organizations use advanced cameras, drones, and monitoring software to track public behaviour and collect data on individuals in both public and private spaces. While these technologies are justified for security purposes, they can easily be misused to monitor citizens without consent. Facial recognition systems, biometric scanners and location-tracking devices can identify people in crowds, track their movements, and store sensitive information in large databases. Such constant monitoring reduces ~~an~~ personal freedom and creates a sense of being watched all the time. In some cases, data

leaks or unauthorized access to national databases have exposed citizens sensitive information, showing how unsafe these systems can become if not properly protected. Surveillance technologies provide safety benefits^{but}, they also poses significant risks by exposing individual private information.

Another major threat to privacy comes from the smartphones we use everyday. They are essential for communication, work and entertainment but also function as powerful tracking devices that constantly collect personal information. They record location through GPS, monitor app activity, store contacts, track browsing history and even pick up voice data through built-in microphones. Many apps continue gathering data in the background and share it with advertisers, tech companies or unknown third parties. Features like Wi-Fi, Bluetooth, and mobile networks reveal where a person goes, how long they stay and what they do online. In some situations, governments and hackers can

access this data, exposing sensitive information such as photos, messages, identity documents and banking apps. Because of this continuous monitoring, smartphones turn into detailed digital diaries, making personal lives open to tracking and misuse. It becomes even more serious when combined with modern AI technologies.

While smartphones collect vast amounts of personal information, the danger becomes even greater when this data is targeted by cybercriminals.

Cybercrime has emerged as one of the most serious threats to privacy in the digital age. Hackers use fake emails and websites, harmful softwares, unsecured networks to steal passwords, bank details, identity documents, private messages and personal photos. Social media accounts are frequent targets, leading to identity theft, blackmail or spreading false information. Cyber-criminals often operate in organized networks, selling stolen data on the dark web for fraud, financial scams, and for personal matters.

DAY: _____

Even large organizations including banks, hospitals, and government agencies, have suffered major breaches, proving that no system is entirely safe. As people rely more on digital devices, cybercrime continues to grow, showing that private information is constantly at risk.

Artificial Intelligence (AI) and facial recognition technologies present even greater risks to personal privacy. These systems can automatically identify, track, and analyze individuals in public spaces or online without their knowledge or consent. AI-powered cameras in cities, airports, and social media platforms can match faces with databases, revealing personal identity, daily routines, and movement patterns. While it is designed for security or convenience, such technologies can easily be misused to monitor citizens, target specific groups or manipulate behavior. Combined with smartphones, social media and surveillance systems, AI can process massive amounts of personal data, creating detailed profiles that were previously impossible.

DAY: _____

Unauthorized access or leaks of this information can lead to harassment, identity theft, or political manipulation. Therefore, although AI and facial recognition offer innovative tools, they significantly heighten privacy risks in the modern digital world.

In addition to AI and facial recognition data breaches represent another major threat to privacy in the digital age. A data breach occurs when sensitive information stored by companies or government is accessed, stolen or exposed without authorization. These breaches can affect millions of users at once, compromising personal details such as names, addresses, passwords, financial records, and even medical information. High profile cases, such as Facebook - Cambridge Analytica scandal or breaches of banking and healthcare databases, shows how vulnerable digital systems can be. Hackers or unauthorized insiders can exploit this information for identity theft, financial fraud, or targeted scams. Even strong security measures cannot always prevent breaches.

as attackers continuously find new ways to infiltrate systems. As a result, data breaches highlight the fragility of digital privacy, showing personal information is constantly at risk.

In digital age, technology has brought unprecedented convenience, but it has also created serious threats to privacy at multiple levels. Social media platforms collect vast amounts of personal information, while surveillance systems monitor public behavior, and smartphones track our every movement. Cyber-criminals exploit these technologies to steal sensitive data, AI and facial recognition analyse and identify individuals without consent and frequent data breaches expose stored information on a massive scale. Together these threats show that personal privacy is no longer fully within our control, and the consequences extend beyond individuals to affect national security and public trust. Protecting privacy in this environment requires not only

DAY: _____

Catch personal behaviour but also robust cybersecurity measures, strong regulations and responsible use of technology. Ultimately, the challenge of balancing the benefits of technology with safeguarding privacy has become one of the defining issues of our digital era.
