

## Question #2:

Differentiate between igneous rocks and Metamorphic rocks?

A. Difference b/w Igneous rocks and metamorphic rocks.

1. Igneous rocks:

The type of rocks formed from the cooling and solidification of magma or lava.

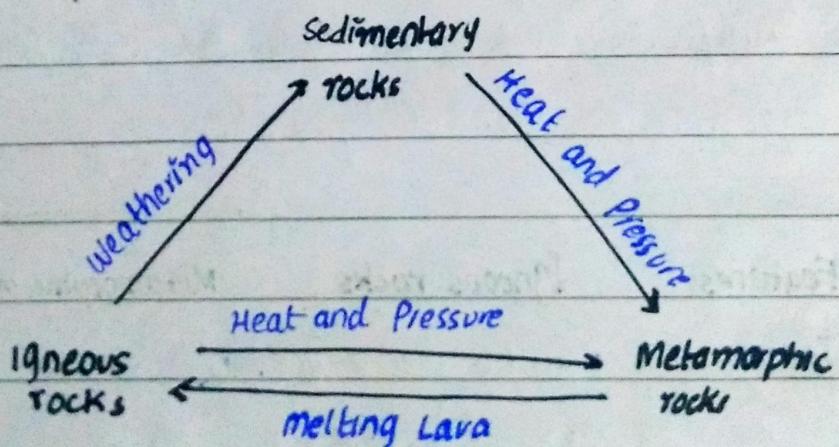

2. Metamorphic rocks:

The type of rocks formed from the transformation of existing rocks under heat, pressure or chemical processes.

Features	Igneous rocks	Metamorphic rocks
Texture	can be coarse grained (intrusive) or fine grained (extrusive)	can have foliated (layered) or no foliated texture.
Examples	Granite, basalt, Pumice	Marble, Schist, slate.

Mineral	Original minerals are	Original minerals
Composition	often crystallized from molten material	are altered or recrystallized
Location	Found near volcanic regions or deep within Earth's crust	Found in regions with tectonic activity or mountain building processes

## The Rock Cycle.

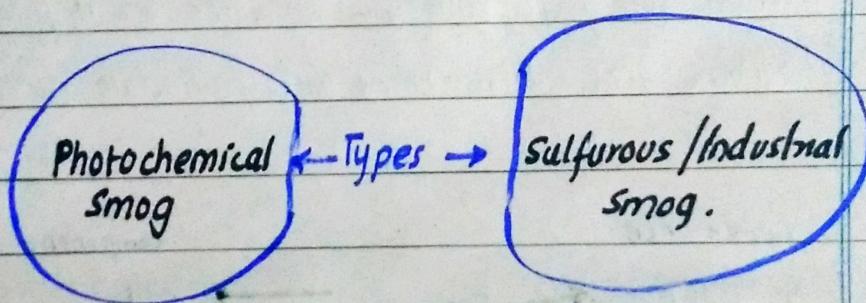

b. Explain the phenomenon of smog and give its types.

### A. Smog:

Smog is a type of intense air pollution that forms when certain pollutants interact with atmospheric conditions.

The term "smog" comes from a combination of "smoke" and "fog", as it often appears as a thick hazy layer in the air.

### B. Types of Smog.

#### 1. Photochemical smog:

It occurs when sun-light reacts with nitrogen oxides ( $\text{NO}_x$ ) and volatile organic compounds usually emitted by vehicles and industrial processes.

### Appearance

Brownish or  
yellowish haze

### Main component

Ground level ozone  
PANs and aldehydes

### Features

common in sunny,  
Urban areas with  
high traffic

### Example

New Delhi,

Los Angeles,  
Lahore.

## 2. Sulfurous smog (Industrial smog).

It results from burning Fossil fuels, especially coal, which release sulfur dioxide ( $\text{SO}_2$ )

when  $\text{SO}_2$  react with moisture in the air, it forms sulfuric acid and combined with particulate matter

### Appearance

grayish haze

### Features

common in cold  
and humid climates

### Component

Sulfur dioxide,  
Particulate matter,  
 $\text{H}_2\text{SO}_4$ .

### Example

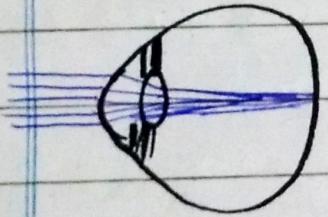

industrial areas  
"Great smog of  
London"

Q.

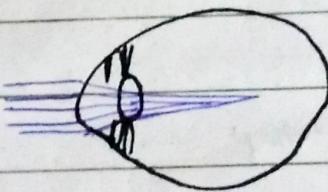

Explain short and far sightedness -

#### A. Short Sightedness:

Short Sightedness or near sightedness is also known as myopia. It is the defect of an eye in which a person can see nearby objects clearly, but has a blurred vision when looking at things at a distance.

Normal eye

Light Eye Focused  
in Front of retina  
(Myopia).

#### Causes:

- It is likely to result from the combination of genes and life style factors (such as spending long periods of time doing close-up work or indoors)
- It often runs in families

## 2. Treatment.

- corrective concave lenses
- contact lenses
- LASIK surgery

## 3. Far sightedness:

Far sightedness, also known as Hyperopia is an eye condition that causes blurry vision when looking at things close up (like words in a book)

### 1. Symptoms

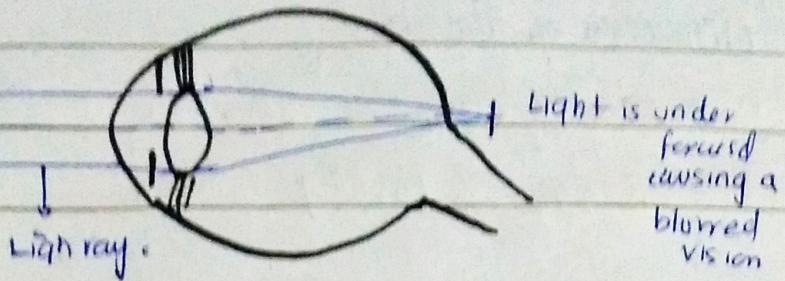

- Blurry vision
- Difficulty reading
- Dull pain in eyes
- Eye strain

### 2. Causes.

- Having an eye ball that's relatively short (decreased axial length)
- Having a cornea that's flatter than expected.

### 3. Treatment.

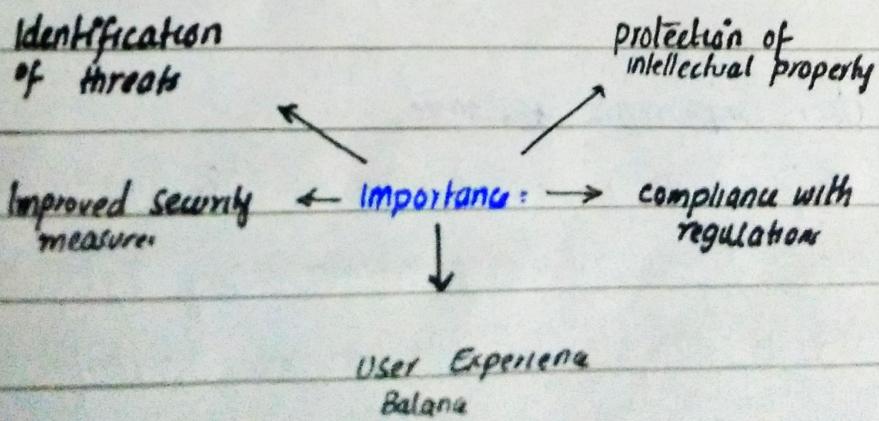

- corrective convex lenses
- refractive surgery

c. Give the importance of risk management in assessment in DRM.

#### A. Importance of Risk assessment in DRM:

Risk assessment is a critical step in designing and implementing effective DRM strategies to protect digital content. It helps identify potential vulnerabilities and ensure proper measures are in place.

## 1. Identification of Threats

It helps to recognize risks like unauthorized access, piracy and hacking attempts.

## 2. Protection of Intellectual Property

It ensures that creators and publishers maintain control over their content.

## 3. Compliance with Regulations

It ensures adherence to copyright laws and licensing agreements, and reduce legal risks associated with non-compliance.

## 4. Improved security Measures

It guides the development of robust encryption and access control mechanisms.

## 5. User Experience Balance

It helps implement DRM solutions that protect content without overly inconveniencing legitimate users. It also identifies risks of user dissatisfaction due to restrictive policies.

21  
a. write a note on solar system

### A. Solar system:

The Solar system is a collection of celestial bodies including the sun, planets, moons, asteroids, comets and other objects, that are bound together by gravity.

- It is located in the Milky way galaxy and forms a significant part of our cosmic neighbourhood.

### B. Key Components:

#### Sun

central star

massive ball of H and He gas

sun's gravitational pull keeps all other objects in <sup>orbit</sup> ~~ptt~~ around it

#### Planets.

Eight planets, revolve around sun-

Inner planets: Mercury, Venus, Mars, Earth

Outer planets: Jupiter, Saturn, Uranus,

Neptune.

## Moons-

in planets

natural satellites that orbit  
planet

## Dwarf Planets

smaller planet, that do not have  
clear orbits e.g. Pluto

## Asteroids

Rocky objects found in Asteroid  
Belt between Mars and Jupiter.

## Comets.

Icy body that originate in  
the outer reaches of the  
solar system.

## The Kuiper Belt:

Region beyond Neptune that  
contains many icy objects  
including dwarf planets  
and comets

## Question 4.

c. Differentiate between RAM and ROM;  
also define the terms nibble, USB and  
Motherboard.

### A Difference between RAM and ROM.

#### i. RAM::

- RAM stands for Random Access Memory.
- RAM is used to temporary store date while the computer is on.
- The Data in RAM is volatile in nature, meaning that at soon as it loses power, that data disappear.
- It is more flexible, but expensive.

#### ROM:

- ROM stands for Read only Memory.
- It refers to permanent memory.
- It's non volatile.
- It generally can't be changed after its' created.
- It is cheaper as compared to RAM.

## B- Motherboard:

The motherboard is the main circuit board in a computer, connecting all essential components like the CPU, RAM, storage and peripherals. It facilitates communication between hardware components through buses and chipsets.

## C- Nibble:

It is also called as "nybble" and "nibble" when referring to a "byte".

It is a second smallest unit of information for data transmission and storage. It corresponds to half of a byte and thus four bits.

## D- USB:

USB (Universal Serial Bus) is a technology used to connect computers to peripheral devices, such as printers, scanners or keyboards etc.

b. Give the importance of

Pituitary gland:

Pituitary Gland:

It is a small pea sized organ located at the base of hypothalamus. It is often referred to as master gland because it regulate and control many vital body functions through hormone secretion.

Importance :

Endocrine Regulation:

It produces and release various hormones that regulate vital body processes.

such as growth hormone, prolactin, Thyroid stimulating hormone, ACTH.

Control of the Endocrine System:

It control and coordinate the activities of

other endocrine glands such as thyroid gland,

adrenal gland, gonads etc.

## Water and Blood Pressure Regulation..

The posterior pituitary release ADH (Antidiuretic hormone) which regulate the body's water balance by reducing water loss in kidneys.

## Growth and Development

It secrete growth hormone through which it supports overall growth, bone formation and the development of muscles.

## Reproduction.

It produce hormones which are vital in the reproductive processes such as menstrual cycle in females and sperm production in males.

## Stress Response.

Its secretion of ACTH triggers the release of cortisol from adrenal gland, helping the body manage stress by regulating metabolism and the immune response.
