3.8) Lack of checks and balances.

#### 4) IMPACTS OF MAKING HASTE? :-

4.1) Product or service with deteriorated quality ✓

4.2) Greater time consumption to repair the damages ✓

4.3) Repetition of work

4.4) Damaged beyond control

#### 5) CONCLUSION :- ✓

\* - Undergoing something very quickly  
without giving ~~it~~ a second  
could be ~~damaging~~

\* Essential to perform tasks slowly  
~~and~~ with focus <sup>and care</sup> on the gritty  
grittys of the ~~task~~

In today's fast moving world, everyone is undergoing multitasking all the times. To do so much in very less time is the norm being practiced in today's world. Multitasking, adopting quicker shorter ways are promoted to perform and complete more tasks. But performing any task, act or service quickly without completely comprehending it has its own negative impacts. The repercussions are far-reaching from poor quality of the task or service, <sup>to</sup> repetition required to repair the damages that leads to greater consumption of time than expected or previously originally spent on the task. There are a number of reasons for the wastage of the product or service when performing it rapidly.

or with excessive speed. Some of them being lack of precision in performing the task, lesser attention to detail, decreased critical thinking and cost-benefit analysis. These and some other reasons could lead to damages beyond repair, so caution, care and focus is needed in performing any action.

First and foremost, excessive speed and urgency can lead to the damage of that task due to lack of precision. An act that is performed very quickly usually lacks accuracy and detail. This impacts the general quality of the product or services. It does not match the requirement as less care, precision is adopted while performing the task or service. This can lead to many negative

repercussions, not just in terms of quality but also time and energy. Thus by undergoing any action with great speed, and urgency can damage the product or service that and can lead to negative outcomes for the performer, as his time and energy gets wasted.

Similarly, performing tasks too quickly and adopting short cuts that are less time

consuming can lead to the wastage and underutilization of the product or service.

As it does not quality for the standards and does not pass quality assurances leading to wastage of time, energy and negative impacts on the person's reputation as well. The products, tasks or

Services that are performed with haste can clearly be differentiated from the ones performed with ease, due to the difference in quality of the tasks. As these services and products lack quality assurance as they undergo short and quick (supply chain) methods to complete. Thus leading to poor quality product and service. This severely damages the company's or person's reputation and future expectations. So, haste makes a lot of damage (for the one) in terms of wasted time, energy and no utilization of product or service.

Furthermore, (the concept of) adopting haste in performing any act in life leads to a damaged product or service and

wastage of time, energy and resources as it lacks critical thinking. When a service is performed or a task is completed or a question is solved without undergoing in-depth analysis and thorough critical thinking, it lacks depth. A critical analysis that can improve the quality of the tasks and covers all aspects of the service/product or task: lacking this in performing any act severely damages the product quality. Many a times, repetition of the same task is required to enhance the quality and cater to all aspects of the task. Thus hasty decisions and performance of any task can lead to wastage of resources, repetition

of the task due to lack of  
thorough <sup>critical</sup> analysis ~~and~~ of the  
task, and a superficial result
