 - ④ Research and Technology
- ## Conclusion

Essay

Natural disasters such as earthquakes, floods, cyclones and droughts etc have become frequent and intense with climate change and environmental degradation. These not only devastates lives and infrastructure but also a test of nation's capacity to respond, recover and rebuild. National resilience means the ability of a country to withstand shocks and adapt to adversity. It emerge as defining factor to determine how societies cope with such crises. Nation with good governance, effective disaster management system and economic stability recover faster, while those countries ~~who are~~ ^{with} weak planning and poor coordination suffer prolonged. True national resilience goes beyond response, it includes long-term strategies of prevention, risk reduction

and adaptation. It requires investment in technology, public awareness programs, early warning systems and sustainable growth. Natural disasters test national resilience by revealing its preparedness, leadership and unity in transforming destruction into recovery and long-term sustainable growth.
