

Drought is a type of natural disaster that silently cause chaos. In the current era drought has become an inevitable and unavoidable issue, mainly caused by ^{several factors of} ~~climate change~~ Diverse rain patterns; ^{intense} heavy rainfall accompanied by harsh winds; lower or delayed rainfall often contribute to drought.

Monsoon spell of August and September, 2025, was the most severe phase of the season that caused widespread devastation and swept away ~~at~~ through acres of agricultural land (NDMA).

Hence ~~climate~~ the changes in rainfall pattern is one of most prominent factors of climate change that contribute to drought.

Among the factors of climate change, in addition to diverse rain patterns intense summers are also among the major factors. The above average temperature

of summers usually with intense heatwaves leads to the frequent drying of soil. Due to intense heat ~~soil~~ ^{plants} cannot retain water and the plants ~~become~~ ^{suffer from} heat stress with temperature above ~~the~~ ^{moderate} threshold level, even ~~not~~ ^{controlled} cannot ~~be~~ ^{relieved} by rainfalls.

According to NDMA highest temperature in 2025 that hit Islamabad was

45°C with average temperature of 39°C. Beside agricultural drought

water drought will dominate the world as early as by 2030 by 40%.

In a nutshell drought regardless of its nature and source a life threatening disaster of job nature.

Beside the natural causes of a drought

it is also caused ~~by~~ due to lack of effective policies and neglect.

Even though it is clear that drought is

a natural disaster but it can

be avoided ~~and~~ ^{or} influenced by

human interactions. There is no effective

policy to store water in water reservoirs during intense rainfall, but it often results in ~~floods~~ flooding. Similarly lack of agricultural planning; integration of modern agricultural techniques is not practiced world wide. ~~Only~~ 70 countries have adopted modern agricultural techniques to combat drought. ~~Most~~ ^{several} of the middle east^{ern} and south asian countries lack water reservoirs. Hence ~~introduction~~ ^{lack} of practicing new techniques to combat drought is also one of the prominent cause of drought.
